# **Micropython-Stubber**

***Release 1.11.6***

**Jos Verlinde**

**Feb 05, 2023**

## CONTENTS:

<b>1</b>	<b>Boost MicroPython productivity in VSCode</b>	<b>1</b>
1.1	Licensing . . . . .	2
<b>2</b>	<b>Approach to collecting stub information</b>	<b>3</b>
2.1	Stub collection process . . . . .	4
2.2	Firmware Stubs format and limitations . . . . .	4
2.3	Stub naming convention . . . . .	4
<b>3</b>	<b>stubber</b>	<b>7</b>
3.1	build . . . . .	7
3.2	clone . . . . .	8
3.3	enrich . . . . .	8
3.4	get-core . . . . .	9
3.5	get-docstubs . . . . .	9
3.6	get-frozen . . . . .	10
3.7	get-lobo . . . . .	10
3.8	merge . . . . .	11
3.9	minify . . . . .	12
3.10	publish . . . . .	12
3.11	show-config . . . . .	13
3.12	stub . . . . .	13
3.13	switch . . . . .	14
3.14	update-fallback . . . . .	14
3.15	update-module-list . . . . .	15
<b>4</b>	<b>Using stubs</b>	<b>17</b>
4.1	Manual configuration . . . . .	17
4.2	using micropython-stubber . . . . .	17
4.3	Using micropy-cli . . . . .	17
<b>5</b>	<b>VSCode and Pylint configuration</b>	<b>19</b>
5.1	Recommended order of the stubs in your config: . . . . .	19
5.2	Relevant VSCode settings . . . . .	19
5.3	pylint . . . . .	21
5.4	Microsoft Python Language Server settings - Deprecated . . . . .	21
<b>6</b>	<b>Create Firmware Stubs</b>	<b>23</b>
6.1	Running the script . . . . .	23
6.2	Generating Stubs for a specific Firmware . . . . .	24
6.3	Downloading the files . . . . .	24
6.4	Custom firmware . . . . .	24

6.5	The Unstubbables . . . . .	25
<b>7</b>	<b>createstub variants</b>	<b>27</b>
7.1	board/createstubs.py . . . . .	27
7.2	board/createstubs_mem.py . . . . .	27
7.3	Optimisations . . . . .	28
<b>8</b>	<b>CPython and Frozen modules</b>	<b>29</b>
8.1	Frozen Modules . . . . .	29
8.2	Collect Frozen Stubs (micropython) . . . . .	29
8.3	Postprocessing . . . . .	30
<b>9</b>	<b>Documentation Stubs</b>	<b>31</b>
9.1	What / Why . . . . .	31
9.2	How docstubs are generated . . . . .	31
<b>10</b>	<b>Repo structure</b>	<b>35</b>
10.1	This and sister repos . . . . .	35
10.2	Structure of this repo . . . . .	35
10.3	Naming Convention and Stub folder structure . . . . .	36
10.4	Create a symbolic link . . . . .	36
<b>11</b>	<b>PowerShell Scripts</b>	<b>39</b>
11.1	bulk_stubber.ps1 . . . . .	39
<b>12</b>	<b>Overview of Stubs</b>	<b>41</b>

## BOOST MICROPYTHON PRODUCTIVITY IN VSCODE

The intellisense and code linting that is so prevalent in modern editors, does not work out-of-the-gate for MicroPython projects. While the language is Python, the modules used are different from CPython, and also different ports have different modules and classes, or the same class with different parameters.

Writing MicroPython code in a modern editor should not need to involve keeping a browser open to check for the exact parameters to read a sensor, light-up a led or send a network request.

Fortunately with some additional configuration and data, it is possible to make the editors understand your flavor of MicroPython. even if you run a on-off custom firmware version.

In order to achieve this a few things are needed:

- 1) Stub files for the native / enabled modules in the firmware using PEP 484 Type Hints
- 2) Specific configuration of the VSCode Python extensions
- 3) Specific configuration of Pylint
- 4) Suppression of warnings that collide with the MicroPython principals or code optimization.

With that in place, VSCode will understand MicroPython for the most part, and help you to write code, and catch more errors before deploying it to your board.

Note that the above is not limited to VSCode and pylint, but it happens to be the combination that I use.

A lot of subs have already been generated and are shared on github or other means, so it is quite likely that you can just grab a copy to be productive in a few minutes.

For now you will need to *configure this by hand*, or use the *micropy cli tool*

1. The sister-repo **[MicroPython-stubs]**[stubs-repo] contains [all stubs][all-stubs] I have collected with the help of others, and which can be used directly. That repo also contains examples configuration files that can be easily adopted to your setup.
2. A second repo [micropy-stubs repo][stubs-repo2] maintained by BradenM, also contains stubs but in a structure used and distributed by the *micropy-cli* tool. you should use micropy-cli to consume stubs in this repo.

The (stretch) goal is to create a VSCode add-in to simplify the configuration, and allow easy switching between different firmwares and versions.

## 1.1 Licensing

MicroPython-Stubber is licensed under the MIT license, and all contributions should follow this [LICENSE](#).

## APPROACH TO COLLECTING STUB INFORMATION

The stubs are used by 3 components.

1. the VSCode Pylance Language Server
2. the VSCode Python add-in
3. a linter such as pylint

These 3 tools work together to provide code completion/prediction, type checking and all the other good things. For this the order in which these tools use, the stub folders is significant, and best results are when all use the same order.

In most cases the best results are achieved by the below setup:

1. **Your own source files**, including any libraries you add to your project. This can be a single `libs` folder or multiple directories. There is no need to run stubber on your source or libraries.
2. **The CPython common stubs**. These stubs are handcrafted to allow MicroPython script to run on a CPython system. There are only a limited number of these stubs and while they are not intended to be used to provide type hints, they do provide valuable information. Note that for some modules (such as the `gc`, `time` and `sys` modules) this approach does not work.

3. **Frozen stubs.** Most micropython firmwares include a number of python modules that have been included in the firmware as frozen modules in order to take up less memory. These modules have been extracted from the source code.
4. **Firmware Stubs.** For all other modules that are included on the board, [micropython-stubber] or [micropy-cli] has been used to extract as much information as available, and provide that as stubs. While there is a lot of relevant and useful information for code completion, it does unfortunately not provide all details regarding parameters that the above options may provide.

## 2.1 Stub collection process

- The **CPython common stubs** are periodically collected from the [micropython-lib][] or the [pycopy-lib][].
- The **Frozen stubs** are collected from the repos of [micropython][] + [micropython-lib][] and from the [loboris][] repo the methods to gather these differs per firmware family , and there are differences between versions how these are stored , and retrieved. where possible this is done per port and board, or if not possible the common configuration for has been included.
- the **Firmware stubs** are generated directly on a MicroPython board.

## 2.2 Firmware Stubs format and limitations

1. No function parameters are generated
2. No return types are generated
3. Instances of imported classes have no type (due to 2)
4. The stubs use the .py extension rather than .pyi (for autocomplete to work)
5. Due to the method of generation nested modules are included, rather than referenced. While this leads to somewhat larger stubs, this should not be limiting for using the stubs on a PC.

## 2.3 Stub naming convention

The firmware naming conventions is most relevant to provide clear folder names when selecting which stubs to use.

for stubfiles: {**firmware family**}-{version}-{port}

for frozen modules : {firmware}-{version}-frozen{port}{board}

- **firmware family**: lowercase
  - micropython | loboris | pycopy | ...
- **port**: lowercase , as reported by os.implementation.platform
  - stm32 | esp32 | linux | win32 | rp2 | samd | ...
- **board**: used mainly for frozen stubs
  - GENERIC | RELEASE | UM\_TINYICO | GENERIC\_512K | ARDUINO\_NANO\_RP2040\_CONNECT | ...

*Note:* RELEASE appears to be used mainly for CI/CD purposes and is not commonly used on hardware.

- **version** : digits only , dots replaced by underscore, follow version in documentation rather than semver

- v1\_13
- v1\_9\_4
- **build**, only for nightly build, the build nr. extracted from the git tag
  - \* Nothing , for released versions
  - \* 103
  - \* Latest

## STUBBER

```
stubber [OPTIONS] COMMAND1 [ARGS]... [COMMAND2 [ARGS]...]...
```

### Options

**--version**

Show the version and exit.

**-v, --verbose**

-v for DEBUG, -v -v for TRACE

## 3.1 build

Commandline interface to publish stubs.

```
stubber build [OPTIONS]
```

### Options

**--family** <family>

**Default**

micropython

**-V, --version, --Version** <versions>

multiple:

**Default**

1.19.1

**-p, --port** <ports>

multiple:

**Default**

auto

**-b, --board** <boards>

multiple:

**Default**  
generic

**--clean**  
clean folders after processing and publishing

**--force**  
build package even if no changes detected

## 3.2 clone

Clone/fetch the micropython repos locally.

The local repos are used to generate frozen-stubs and doc-stubs.

```
stubber clone [OPTIONS]
```

### Options

**-p, --path <path>**

**--add-stubs, --no-stubs**  
Also clone the micropython-stubs repo

## 3.3 enrich

Enrich the stubs in stub\_folder with the docstubs in docstubs\_folder.

```
stubber enrich [OPTIONS]
```

### Options

**-s, --stubs <stubs\_folder>**  
folder containing the firmware stubs to be updated

**Default**  
repos/micropython-stubs/stubs

**-ds, --docstubs <docstubs\_folder>**  
folder containing the docstubs to be applied

**Default**  
repos/micropython-stubs/stubs

**--diff**  
Show diff

**Default**  
False

### **--dry-run**

Dry run does not write the files back

#### **Default**

False

## 3.4 get-core

Download core CPython stubs from PyPi.

Get the core (CPython compat) modules for both MicroPython and Pycopy.

```
stubber get-core [OPTIONS]
```

### Options

**--stubs, --stub-folder** <stub\_folder>

#### **Default**

repos/micropython-stubs/stubs

**--pyi, --no-pyi**

Create .pyi files for the (new) frozen modules

#### **Default**

True

**--black, --no-black**

Run black on the (new) frozen modules

#### **Default**

True

## 3.5 get-docstubs

Build stubs from documentation.

Read the Micropython library documentation files and use them to build stubs that can be used for static typechecking.

```
stubber get-docstubs [OPTIONS]
```

### Options

**-p, --path** <path>

#### **Default**

repos

**--stub-path, --stub-folder** <target>

Destination of the files to be generated.

#### **Default**

repos/micropython-stubs/stubs

**-f, --family** <basename>

Micropython family.

**Default**

micropython

**-b, --black, -nb, --no-black**

Run black

**Default**

True

## 3.6 get-frozen

Get the frozen stubs for MicroPython.

Get the frozen modules for the checked out version of MicroPython

```
stubber get-frozen [OPTIONS]
```

### Options

**--stubs, --stub-folder** <stub\_folder>

**Default**

repos/micropython-stubs/stubs

**--version, --tag** <version>

Version number to use. [default: Git tag]

**--pyi, --no-pyi**

Create .pyi files for the (new) frozen modules

**Default**

True

**--black, --no-black**

Run black on the (new) frozen modules

**Default**

True

## 3.7 get-lobo

Get the frozen stubs for Lobo-esp32.

```
stubber get-lobo [OPTIONS]
```

## Options

**-stubs, --stub-folder** <stub\_folder>

**Default**  
repos/micropython-stubs/stubs

**--pyi, --no-pyi**  
Create .pyi files for the (new) frozen modules

**Default**  
True

**--black, --no-black**  
Run black on the (new) frozen modules

**Default**  
True

## 3.8 merge

Enrich the stubs in stub\_folder with the docstubs in docstubs\_folder.

```
stubber merge [OPTIONS]
```

## Options

**--family** <family>

**Default**  
micropython

**-V, --version, --Version** <versions>  
'latest', 'auto', or one or more versions

**Default**  
auto

**-p, --port** <ports>  
multiple:

**Default**  
auto

**-b, --board** <boards>  
multiple:

**Default**  
generic

## 3.9 minify

Minify createstubs\*.py.

Creates a minified version of the SOURCE micropython file in TARGET (file or folder). The goal is to use less memory / not to run out of memory, while generating Firmware stubs.

```
stubber minify [OPTIONS]
```

### Options

**-s, --source** <source>

**Default**

board/createstubs.py

**-t, --target** <target>

**Default**

./minified

**-d, --diff**

Show the functional changes made to the source script.

**-c, -xc, --compile**

Cross compile after minification.

**-a, --all**

Minify all variants (normal, \_mem and \_db).

**--report, --no-report**

Keep or disable minimal progress reporting in the minified version.

**Default**

True

## 3.10 publish

Commandline interface to publish stubs.

```
stubber publish [OPTIONS]
```

### Options

**--family** <family>

**Default**

micropython

**-V, --version, --Version** <versions>

multiple:

**Default**

1.19.1

**-p, --port** <ports>  
 multiple:  
     **Default**  
     auto

**-b, --board** <boards>  
 multiple:  
     **Default**  
     generic

**--pypi, --test-pypi**  
 publish to PYPI or Test-PYPI  
     **Default**  
     False

**--build**  
 build before publish

**--force**  
 create new post release even if no changes detected

**--dry-run**  
 Do not actually publish, just show what would be done

**--clean**  
 clean folders after processing and publishing

## 3.11 show-config

Show the current configuration

```
stubber show-config [OPTIONS]
```

## 3.12 stub

Create or update .pyi type hint files.

```
stubber stub [OPTIONS]
```

### Options

**-s, --source** <source>

## 3.13 switch

Switch to a specific version of the micropython repos.

The Micropython-lib repo will be checked out to a commit that corresponds in time to that version tag, in order to allow non-current versions to be stubbed correctly.

The repos must be cloned already

```
stubber switch [OPTIONS] [[v1.9.3|v1.9.4|latest]]
```

### Options

**-p, --path** <path>

### Arguments

**TAG**

Optional argument

## 3.14 update-fallback

Update the fallback stubs.

The fallback stubs are updated/collated from files of the firmware-stubs, doc-stubs and core-stubs.

```
stubber update-fallback [OPTIONS]
```

### Options

**--version** <version>

Version number to use

**Default**

v1\_18

**--stub-folder** <stub\_folder>

Destination of the files to be generated.

**Default**

repos/micropython-stubs/stubs

## 3.15 update-module-list

Update the module list based on the information in the data folder

```
stubber update-module-list [OPTIONS]
```

## USING STUBS

### 4.1 Manual configuration

The manual configuration, including sample configuration files is described in detail in the sister-repo [micropython-stubs][1] section [using-the-stubs][2]

### 4.2 using micropython-stubber

You can install micropython stubber from PyPi using `pip install micropython-stubber`.

### 4.3 Using micropy-cli

‘micropy-cli’ is command line tool for managing MicroPython projects with VSCode If you want a command line interface to setup a new project and configure the settings as described above for you, then take a look at : [micropy-cli]

```
pip install micropy-cli
micropy init
```

Braden has essentially created a front-end for using micropython-stubber, and the configuration of a project folder for pymakr.

micropy-cli maintains its own repository of stubs.

## VSCODE AND PYLINT CONFIGURATION

The current configuration section describes how to use [Pylance].

Pylance leverages type stubs ([.pyi files](#)) and lazy type inferencing to provide a highly-performant development experience. Pylance supercharges your Python IntelliSense experience with rich type information, helping you write better code, faster.

The Pylance extension is also shipped with a collection of type stubs for popular modules to provide fast and accurate auto-completions and type checking.

Some sections may still refer to the use of [Microsoft Python Language Server][mpls], which has been deprecated.

### 5.1 Recommended order of the stubs in your config:

1. The src/libs folder(s)
2. The CPython common modules
3. The frozen modules offer more information that can be used in code completion, and therefore should be loaded before the firmware stubs.
4. The firmware stubs generated on or for your board

[Announcing Pylance: Fast, feature-rich language support for Python in Visual Studio Code | Python \(microsoft.com\)](#)

### 5.2 Relevant VSCode settings

Setting	De-fault	Description	ref
python.autoComplete.extraPaths	[]	Specifies locations of additional packages for which to load autocomplete data.	<a href="#">Autocomplete Settings</a>
typeshedPaths	[]	Specifies paths to local typeshed repository clone(s) for the Python language server.	<a href="#">Git</a>
python.linting.			<a href="#">Linting Settings</a>
enabled	true	Specifies whether to enable linting in general.	
pylintEnabled	true	Specifies whether to enable Pylint.	

## 5.2.1 Pylance - pyright

[Pylance]([Pylance - Visual Studio Marketplace](#)) is replacing MPLS and provides the same and more functionality.

Setting	De-fault	Description
<code>python.analysis.stu</code>	<code>./typ-ings</code>	Used to allow a user to specify a path to a directory that contains custom type stubs. Each package's type stub file(s) are expected to be in its own subdirectory.
<code>python.analysis.au</code>	<code>true</code>	Used to automatically add search paths based on some predefined names (like <code>src</code> ).
<code>python.analysis.ext</code>	<code>[]</code>	Used to specify extra search paths for import resolution. This replaces the old <code>python.autoComplete.extraPaths</code> setting.

## 5.2.2 Sample configuration for Pylance

To update a project configuration from MPLS to Pylance is simple :

Open your VSCode settings file : `.vscode/settings.json`

- change the language server to Pylance `"python.languageServer": "Pylance",`
- remove the section: `python.autoComplete.typeShedPaths`
- remove the section : `python.analysis.typeShedPaths`
- optionally add : `"python.analysis.autoSearchPath": true,`

The result should be something like this :

```
{
  "python.languageServer": "Pylance",
  "python.analysis.autoSearchPath": true,
  "python.autoComplete.extraPaths": [
    "src/lib",
    "all-stubs/cpython_patch",
    "all-stubs/mpy_1_13-nightly_frozen/esp32/GENERIC",
    "all-stubs/esp32_1_13_0-103",
  ]
  "python.linting.enabled": true,
  "python.linting.pylintEnabled": true,
}
```

If you notice problems :

- The paths are case sensitive (which may not be apparent for your platform)
- To allow the config to be used cross platform you can use forward slashes `/`, *note that this is also accepted on Windows*
- If you prefer to use a backslash : in JSON notation the `\` (backslash) MUST be escaped as `\\` (double backslash)
- Remember to put the 'Frozen' module paths before the generated module paths.

possible testing / diag :

pyright/command-line.md at microsoft/pyright (github.com)

## 5.3 pylint

Pylint needs 2 settings :

1. Specify **init-hook** to inform pylint where the stubs are stored. note that the `src` folder is already automagically included, so you do not need to add that.
2. disable some pesky warnings that make no sense for MicroPython, and that are caused by the stubs that have only limited information

File: .pylintrc

```
[MASTER]
# Loaded Stubs:  esp32-micropython-1.11.0
init-hook='import sys;sys.path[1:1] = ["src/lib", "all-stubs/cpython-core", "all-stubs/
↳ mpy_1_12/frozen/esp32/GENERIC", "all-stubs/esp32_1_13_0-103",]'

disable = missing-docstring, line-too-long, trailing-newlines, broad-except, logging-
↳ format-interpolation, invalid-name,

        # the 2nd line deals with the limited information in the generated stubs.
```

## 5.4 Microsoft Python Language Server settings - Deprecated

MPLS is being replaced by Pylance , and the below configuration is for reference only .

The language server settings apply when `python.jediEnabled` is false.

Set-ting	Default	Description	ref
python.je	Default <i>true</i> , must be set to <i>FALSE</i>	Indicates whether to use Jedi as the IntelliSense engine (true) or the Microsoft Python Language Server (false). Note that the language server requires a platform that supports .NET Core 2.1 or newer.	
python.a			code analysis settings)
type-shed-Paths	[]	Paths to look for typeshed modules on GitHub.	

*Our long-term plan is to transition our Microsoft Python Language Server users over to Pylance and eventually deprecate and remove the old language server as a supported option*

## CREATE FIRMWARE STUBS

It is possible to create MicroPython stubs using the `createstubs.py` MicroPython script.

the script goes through the following stages

1. it determines the firmware family, the version and the port of the device, and based on that information it creates a firmware identifier (fwid) in the format : {family}-{port}-{version} the fwid is used to name the folder that stores the stubs for that device.
  - stubs/micropython-v1\_10-stm32
  - stubs/micropython-v1\_12-esp32
  - stubs/loboris-v3\_2\_4-esp32
2. it cleans the stub folder
3. it generates stubs, using a predetermined list of module names. for each found module or submodule a stub file is written to the device and progress is output to the console/repl.
4. a module manifest (`modules.json`) is created that contains the pertinent information determined from the board, the version of `createstubs.py` and a list of the successful generated stubs

### Module duplication

Due to the module naming convention in micropython some modules will be duplicated , ie uos and os will both be included

## 6.1 Running the script

The `createstubs.py` script can either be run as a script or imported as a module depending on your preferences.

Running as a script is used on the linux or win32 platforms in order to pass a `-path` parameter to the script.

The steps are :

1. Connect to your board
2. Upload the script(s) to your board. All variants of the script are located in the `/board` folder of this repo
3. Run/import the `createstubs.py` script
4. Download the generated stubs to a folder on your PC
5. run the post-processor [optional, but recommended]

![createstubs-flow][[]]

**Note:** There is a memory allocation bug in MicroPython 1.30 that prevents `createstubs.py` to work. this was fixed in nightly build v1.13-103 and newer.

If you try to create stubs on this defective version, the stubber will raise *NotImplementedError*("MicroPython 1.13.0 cannot be stubbed")

## 6.2 Generating Stubs for a specific Firmware

The stub files are generated on a MicroPython board by running the script `createstubs.py`, this will generate the stubs on the board and store them, either on flash or on the SD card. If your firmware does not include the logging module, you will need to upload this to your board, or use the minified version.

```
import createstubs
```

The generation will take a few minutes ( 2-5 minutes) depending on the speed of the board and the number of included modules.

As the stubs are generated on the board, and as MicroPython is highly optimized to deal with the scarce resources, this unfortunately does mean that the stubs lacks parameters details. So for these you must still use the documentation provided for that firmware.

## 6.3 Downloading the files

After the sub files have been generated , you will need to download the generated stubs from the micropython board and most likely you will want to copy and save them on a folder on your computer. if you work with multiple firmwares, ports or version it is simple to keep the stub files in a common folder as the firmware id is used to generate unique names

- ./stubs
  - /micropython-v1\_10-stm32
  - /micropython-v1\_12-esp32
  - /micropython-v1\_11-linux
  - /loboris-v3\_1\_20-esp32
  - /loboris-v3\_2\_24-esp32

## 6.4 Custom firmware

The script tries to determine a firmware ID and version from the information provided in `sys.implementation` , `sys.uname()` and the existence of specific modules..

This firmware ID is used in the stubs , and in the folder name to store the subs.

If you need, or prefer, to specify a firmware ID you can do so by setting the `firmware_id` variable before importing `createstubs` For this you will need to edit the `createstubs.py` file.

The recommendation is to keep the firmware id short, and add a version as in the below example.

```
# almost at the end of the file
def main():
    stubber = Stubber(firmware_id='HoverBot v1.2.1')
    # Add specific additional modules to be stubbed
```

(continues on next page)

(continued from previous page)

```
stubber.add_modules(['hover', 'rudder'])
```

after this , upload the file and import it to generate the stubs using your custom firmware id.

## 6.5 The Unstubbables

There are a limited number of modules that cannot be stubbed by createstubs.py for a number of different reasons. Some simply raise errors , others may reboot the MCU, or require a specific configuration or state before they are loaded.

a few of the frozen modules are just included as a sample rather than it would not be very useful to generate stubs for these the problematic category throw errors or lock up the stubbing process altogether:

```
self.problematic=["upysh", "webrepl_setup", "http_client", "http_client_ssl", "http_server",
↪ "http_server_ssl"]
```

The excluded category provides no relevant stub information

```
self.excluded=["webrepl", "_webrepl", "port_diag", "example_sub_led.py", "example_pub_
↪ button.py"]
```

createstubs.py will not process a module in either category.

Note: that some of these modules are also included in the frozen modules that are gathered for those ports or boards. For those modules it makes sense to use/prioritize the .pyi stubs for the frozen modules over the firmware stubs.

## CREATESTUB VARIANTS

There are two variant of the script available, in 3 levels of optimisation:

variant	full documented script	minified script (no logging)	cross-compiled script
full version	board/createstubs.py	minified/createstubs.py	minified/createstubs.mpy
memory optimized	board/createstubs_mem.py	mini-fied/createstubs_mem.py	mini-fied/createstubs_mem.mpy

In all cases the generation will take a few minutes ( 2-5 minutes) depending on the speed of the board and the number of included modules. As the stubs are generated on the board, and as MicroPython is highly optimized to deal with the scarce resources, this unfortunately does mean that the stubs lacks parameters details. So for these you must still use the documentation provided for that firmware.

### 7.1 board/createstubs.py

this is the core version of the script, and is fully self contained, but includes logging with requires the logging module to be avaialble on your device If your firmware does not include the logging module, you will need to upload this to your board, or use the minified version.

```
import createstubs
```

### 7.2 board/createstubs\_mem.py

This variant of the createstubs.py script is optimised for use on low-memory devices, and reads the list of modules from a text file, rather than including it in the source file. as a result this requires an additional file `./modulelist.txt`, that should be uploaded to the device. If that cannot be found then only a single module (micropython) is stubbed.

```
import createstubs_mem
```

## 7.3 Optimisations

In order to run this on low-memory devices two additional steps are recommended:

- Minification, using python-minifier to reduce overall size, and remove logging overhead. can be used on all devices
- Cross compilation, using mpy-cross, to avoid the compilation step on the micropython device. The cross-compiled version can only run on specific Micropython 1.12 or newer.

### 7.3.1 Minification

Minified versions, which requires less memory and only very basic logging. this removes the requirement for the logging module on the MCU.

Minifiacation helps reduce the seize of the script, and therefore of the memory usage. As a result the script becomes almost unreadable.

### 7.3.2 Cross compilation

this is specially suited for low memory devices such as the esp8622

## CPYTHON AND FROZEN MODULES

### 8.1 Frozen Modules

It is common for Firmwares to include a few (or many) python modules as ‘frozen’ modules. ‘Freezing’ modules is a way to pre-process .py modules so they’re ‘baked-in’ to MicroPython’s firmware and use less memory. Once the code is frozen it can be quickly loaded and interpreted by MicroPython without as much memory and processing time.

Most OSS firmwares store these frozen modules as part of their repository, which allows us to:

1. Download the \*.py from the (github) repo using `git clone` or a direct download
2. Extract and store the ‘unfrozen’ modules (ie the \*.py files) in a `_Frozen` folder. if there are different port / boards or releases defined , there may be multiple folders such as:
  - stubs/micropython\_1\_12\_frozen
    - /esp32
      - \* /GENERIC
      - \* /RELEASE
      - \* /TINYPICO
    - /stm32
      - \* /GENERIC
      - \* /PYBD\_SF2
3. generate typeshed stubs of these files. (the .pyi files will be stored alongside the .py files)
4. Include/use them in the configuration

ref: <https://learn.adafruit.com/micropython-basics-loading-modules/frozen-modules>

### 8.2 Collect Frozen Stubs (micropython)

This is run daily though the github action workflow : `get-all-frozen` in the `micropython-stubs` repo.

If you want to run this manually

- Check out repos side-by-side:
  - `micropython-stubs`
  - `micropython-stubber`
  - `micropython`

- micropython-lib
- link repos using all\_stubs symlink
- checkout tag / version in the micropython folder  
(for most accurate results should checkout micropython-lib for the same date)
- run `get-frozen`
- run `update_stub`
- create a PR for changes to the stubs repo

## 8.3 Postprocessing

You can run postprocessing for all stubs by running either of the two scripts. There is an optional parameter to specify the location of the stub folder. The default path is `./all_stubs`

```
update_stubs [./mystubs]
```

This will generate or update the `.pyi` stubs for all new (and existing) stubs in the `./all_stubs` or specified folder.

From version '1.3.8' the `.pyi` stubs are generated using `stubgen`, before that the `make_stub_files.py` script was used.

`Stubgen` is run on each 'collected stub folder' (that contains a `modules.json` manifest) using the options : `--ignore-errors --include-private` and the resulting `.pyi` files are stored in the same folder (`foo.py` and `foo.pyi` are stored next to each other).

In some cases `stubgen` detects duplicate modules in a 'collected stub folder', and subsequently does not generate any stubs for any `.py` module or script. then **Plan B** is to run `stubgen` for each separate `*.py` file in that folder. While this is significantly slower and according to the `stubgen` documentation the resulting stubs may of lesser quality, but that is better than no stubs at all.

**Note:** In several cases `stubgen` creates folders in inappropriate locations (reason undetermined), which would cause issues when re-running `stubgen` at a later time. to compensate for this behaviour the known-incorrect `.pyi` files are removed before and after `stubgen` is run see: `cleanup(modules_folder)` in `utils.py`

## DOCUMENTATION STUBS

### 9.1 What / Why

Advantages : they bring the richness of the MicroPython documentation to Pylance. This includes function and method parameters and descriptions, the module and class constants for all documented library modules.

### 9.2 How docstubs are generated

The documentation stubs are generated using `src/stubs_from_docs.py`

- 1) Read the MicroPython library documentation files and use them to build stubs that can be used for static type-checking using a custom-built parser to read and process the micropython RST files
  - This will generate :
    - Python modules (`<module.py>`), one for each `<module>.rst` file
      - \* The module docstring is based on the module header in the .rst file
    - Function definitions
      - \* Function parameters and types based on documentation As the parameter documentaion is sometimes rather abigious or imprecise, the parameters definities are cleaned up based on a hand tuned algoritm
      - \* The function docstring is based on the function description in the .rst file
      - \* The return type of a function is based on phrases used in the documentation, with an override table for functions with insufficient documented information to determine the return type.
    - Classes
      - \* The class docstring is based on the Class description in the .rst file
      - \* **init** method
        - The init parameters are based on the documentation for the class As the parameter documentaion is sometimes rather abigious or imprecise, the parameters definities are cleaned up based on a hand tuned algoritm
        - **init** docstring is based on the Class description in the .rst file
    - Methods
      - \* Method parameters and types based are based on the documentation in the .rst file As the parameter documentaion is sometimes rather abigious or imprecise, the parameters definities are cleaned up based on a hand tuned algoritm

- The method docstring is based on the method description in the .rst file
  - The return type of a method is based on phrases used in the documentation, with an override table for functions with insufficient documented information to determine the return type.
  - Method decorators `@classmethod` and `@staticmethod` are generated based on the use of `py:staticmethod` or `py:classmethod` in the documentation. ref: <https://sphinx-tutorial.readthedocs.io/cheatsheet/>
  - Method parameter names `self` and `cls` are used accordingly.
- Exceptions

## 9.2.1 Return types

- Tries to determine the return type by parsing the docstring.
  - Imperative verbs used in docstrings have a strong correlation to return -> None
  - Recognizes documented Generators, Iterators, Callable
  - Coroutines are identified based tag “This is a Coroutine”. Then if the return type was Foo, it will be transformed to : Coroutine[Foo]
  - A static Lookup list is used for a few methods/functions for which the return type cannot be determined from the docstring.
  - add NoReturn to a few functions that never return ( stop / deepsleep / reset )
  - if no type can be detected the type Any is used

## 9.2.2 Lookup tables :

- src/rst/lookup.py
  - LOOKUP\_LIST
    - \* contains return types for functions and methods
    - \* “module.[class.].function” : ( “type”, probability)
  - NONE\_VERBS
    - \* if no type has been determined, and the docstring starts with one of these verbs, then assume the return type is None
  - MODULE\_GLUE
    - \* Add additional imports to some modules to allow one module to import other supporting modules
    - \* currently only used for lcd160cr and esp32
  - PARAM\_FIXES
    - \* manual fixes needed for parameters ( micropython v.16 & v1.17)
    - \* used to clean up the parameter strings before further interpretation using search and replace
  - CHILD\_PARENT\_CLASS
    - \* List of classes and their parent classes that should be added to the class definition. The documentation contains no clear references of the parent classes so these can only be added based on a (manual) lookup table

- \* Note: The parent class **Exceptions** is determined based on the rst hint `py:exception` and the Class Name.

### 9.2.3 Code Formatting

The generated stub files (.py) are formatted using `black` and checked for validity using `pyright`

Note: `black` on python 3.7 does not like some function defs, this is not treated as an error. `def sizeof(struct, layout_type=NATIVE, /) -> int:`

### 9.2.4 Ordering of inter-dependent classes in the same module

Classes are frequently documented in a different order than they need to be declared in a source file. To accomodate for this the source code is re-ordered to avoid forward references in the code. the coode for this is located in

- `src/rst/classsort.py`
- `src/rst/output_dict.py`

### 9.2.5 Add GLUE imports to allow specific modules to import specific others.

This is based on the `MODULE_GLUE` table to support some modules that need to import other modules or classes.

### 9.2.6 Literals / constants

```
- documentation contains repeated vars with the same indentation
- Module level:
.. code-block::

    .. data:: IPPROTO_UDP
        IPPROTO_TCP

- class level:
.. code-block::

    .. data:: Pin.IRQ_FALLING
        Pin.IRQ_RISING
        Pin.IRQ_LOW_LEVEL
        Pin.IRQ_HIGH_LEVEL

        Selects the IRQ trigger type.

- literals documented using a wildcard are added as comments only
```

- Repeats of definitions in the rst file for similar functions or literals
  - CONSTANTS ( module and Class level )
  - functions
  - methods

## REPO STRUCTURE

- *This and sister repos*
- *Structure of this repo*
- *Naming Convention and Stub folder structure*
- 2 python versions

### 10.1 This and sister repos

repo	Why	Where	example
micropython-stubber	needed to make stubs	in your source folder	develop/micropython-stubber
micropython-stubs	stores collected stubs	next to the stubber	develop/micropython-stubs

---

**Note:**

- recommended is to create a symlink from `develop/micropython-stubber\all-stubs` to `develop/micropython-stubs`
- 

### 10.2 Structure of this repo

The file structure is based on my personal windows environment, but you should be able to adapt that without much hardship to you own preference and OS.

What	Details	Where
stub root	symlink to connect the 2 sister-repos	all_stubs
firmware stubber	MicroPython	board/createstubs.py
minified firmware stubber	MicroPython	minified/createstubs.py
PC based scripts	CPython	src/*
PC based scripts	CPython	process.py
pytest tests		test/*

## 10.3 Naming Convention and Stub folder structure

What	Why	Where
stub root	connect the 2 repos	all_stubs
cpython stubs for micropython core	adapt for differences between CPython and MicroPython	stubs/cpython-core
generated stub files	needed to use stubs	stubs/{firmware}-{port}-{version}-frozen
Frozen stub files	better code intellisense	stubs/{firmware}-{version}-frozen

Note: I found that, for me, using submodules caused more problems than it solved. So instead I link the two main repo's using a [symlink](#).

```
cd /develop

git clone https://github.com/josverl/micropython-stubber.git
git clone https://github.com/josverl/micropython-stubs.git

cd micropython-stubber
poetry install

stubber clone
```

## 10.4 Create a symbolic link

To create the symbolic link to the ../micropython-stubs/stubs folder the instructions differ slightly for each OS/ The below examples assume that the micropython-stubs repo is cloned 'next-to' your project folder. please adjust as needed.

### 10.4.1 Windows 10

Requires Developer enabled or elevated powershell prompt.

```
# target must be an absolute path, resolve path is used to resolve the relative path to
↪absolute
New-Item -ItemType SymbolicLink -Path "all-stubs" -Target (Resolve-Path -Path ../
↪micropython-stubs/stubs)
```

or use `mklink` in an (elevated) command prompt

```
rem target must be an absolute path
mklink /d all-stubs c:\develop\micropython-stubs\stubs
```

## 10.4.2 Linux/Unix/Mac OS

```
# target must be an absolute path  
ln -s /path/to/micropython-stubs/stubs all-stubs
```

## POWERSHELL SCRIPTS

A number of scripts have been written in PowerShell as that is one of my preferred scripting languages. Possibly these scripts could be ported to python , at the cost of more complex handling of OS processes and paths and ports.

(a PR with a port to Python would be appreciated)

### 11.1 bulk\_stubber.ps1

The goal of this script is to run create\_stubs on a set of boards connected to my machine in order to generate new stubs for multiple micropython versions

high level operation:

- Scans the serial ports for connected esp32 and esp8266 devices using `get-serialport.ps1 -chip`
- Uses a (hardcoded) list of firmwares including version + chip type
- for each firmware in that list:
  - Selects the corresponding device and serialport
  - Flashes the micropython version to the device using `flash_MPY.ps1`
  - waits for the device to finish processing any initial tasks ( file system creation etc)

```
rshell -p $serialport --rts 1 repl "~ print('connected') ~"
```

---

**Note:** This is quite sensitive to timing and requires some delays to allow the device to restart before the script continues.

Also a bit of automated manipulation of the RTS (and DTR) signals is needed to avoid needing to press a device's reset button.

---

- Starts the minified version of createstubs.py

```
$createstubs_py = join-path $WSRoot "minified/createstubs.py"  
pyboard --device $serialport $createstubs_py | write-host
```

- Downloads the generated machine-stubs

```
# reverse sync  
# $dest = path relative to current directory  
# $source = path on board ( all boards are called pyboard)
```

(continues on next page)

(continued from previous page)

```
$source = "/pyboard/stubs"  
rshell -p $serialport --buffer-size 512 rsync $source $subfolder | write-host
```

### 11.1.1 Minification and compilation

in order to allow createstubs to be run on low-memory devices there are a few steps needed to allow for sufficient memory

### 11.1.2 Requirements & dependencies

#### Python

- esptool - to flash new firmware to the esp32 and esp8266
- pyboard.py - to upload files and run commands (not the old version on PyPi)
- rshell - to download the folder with stubs

#### PowerShell ../../Firmware

- get-serialport.ps1
- flash\_MPY.ps1

### 11.1.3 Hardware

- ESP32 board + SPIRAM on USB + Serial drivers
- ESP8266 board on USB + Serial drivers

---

**Note:** Multiple boards can be connected at the same time. The script will select the first board of the corresponding type. If a board-type is not present, then no stubs for that device type will be generated.

---

## OVERVIEW OF STUBS

Initially I also stored all the generated subs in the same repo. That turned out to be a bit of a hassle and since then I have moved [all the stubs](#) to the [micropython-stubs](#) repo

Below are the most relevant stub sources referenced in this project.

### 12.1 Firmware and libraries

#### 12.1.1 MicroPython firmware and frozen modules *[MIT]*

<https://github.com/micropython/micropython>

<https://github.com/micropython/micropython-lib>

#### 12.1.2 Pycopy firmware and frozen modules *[MIT]*

<https://github.com/pfalcon/pycopy>

<https://github.com/pfalcon/pycopy-lib>

#### 12.1.3 LoBoris ESP32 firmware and frozen modules *[MIT, Apache 2]*

[https://github.com/loboris/MicroPython\\_ESP32\\_psRAM\\_LoBo](https://github.com/loboris/MicroPython_ESP32_psRAM_LoBo)

### 12.2 Included custom stubs

Github repo	Contributions	License
<a href="#">pfalcon/micropython-lib</a>	CPython backports	MIT
<a href="#">dastultz/micropython-pyb</a>	a pyb.py file for use with IDEs in developing a project for the Pyboard	Apache 2

### 12.2.1 Stub source: MicroPython-lib > CPython backports *[MIT, Python]*

While micropython-lib focuses on MicroPython, sometimes it may be beneficial to run MicroPython code using CPython, e.g. to use code coverage, debugging, etc. tools available for it. To facilitate such usage, micropython-lib also provides re-implementations (“backports”) of MicroPython modules which run on CPython. <https://github.com/pfalcon/micropython-lib#cpython-backports>

### 12.2.2 micropython\_pyb *[Apache 2]*

This project provides a pyb.py file for use with IDEs in developing a project for the Pyboard. <https://github.com/dastultz/micropython-pyb>

## REFERENCES

### 13.1 Inspiration

#### 13.1.1 Thonny - MicroPython \_cmd\_dump\_api\_info *[MIT License]*

The `createstubs.py` script to create the stubs is based on the work of Aivar Annamaa and the Thonny crew. It is somewhere deep in the code and is apparently only used during the development cycle but it showed a way how to extract/generate a representation of the MicroPython modules written in C

While the concepts remain, the code has been rewritten to run on a micropython board, rather than on a connected PC running CPython. Please refer to : [Thonny code sample](#)

#### 13.1.2 MyPy Stubgen

`MyPy stubgen` is used to generate stubs for the frozen modules and for the `*.py` stubs that were generated on a board.

#### 13.1.3 make\_stub\_files *[Public Domain]*

<https://github.com/edreamleo/make-stub-files>

This script `make_stub_files.py` makes a stub (`.pyi`) file in the output directory for each source file listed on the command line (wildcard file names are supported).

The script does no type inference. Instead, the user supplies patterns in a configuration file. The script matches these patterns to: The names of arguments in functions and methods and The text of return expressions. Return expressions are the actual text of whatever follows the “return” keyword. The script removes all comments in return expressions and converts all strings to “str”. This preprocessing greatly simplifies pattern matching.

---

**Note:** It was found that the stubs / prototypes of some functions with complex arguments were not handled correctly, resulting in incorrectly formatted stubs (`.pyi`)  
Therefore this functionality has been replaced by `MyPy stubgen`

---

## 13.2 Documentation on Type hints

- [Type hints cheat sheet](#)
- [PEP 3107 – Function Annotations](#)
- [PEP 484 – Type Hints](#)
- [Optional Static Typing for Python](#)
- [TypeShed](#)
- [SO question](#)

## DOCUMENTATION

This documentation is built using [Sphinx](#) with the bulk of the documents written in markdown and hosted on read the docs.

The markdown files are processed using [Myst](#)

Some diagrams have been generated using [Mermaid](#) and integrated using the [Mermaid plugin](#)

Documentation for the scripts is created using the Sphinx [AutoApi plugin](#)

**CHANGELOG**

- update board stubber to report pyboards as port=stm32
- update filestructure to reflect this change in nameing

**V1.6.8**

- fix: `stubber` `docstubs` failed on methods and function definitions that were split across multiple lines.
- fix: `stubber` `clone` must fetch and pull to get updates from upstream repos

- fix: correct dependencies

- fix: allow switch to micropython 1.9.x versions

- unified different scripts into a single CLI tool
- replace submodules with `stubber clone` command

## 20.1 Tests

- add more clone test variants
- fix incorrect mock
- add minify mock tests
- change coverage reporting to codecov only

## 20.2 Configuration

- add configuration option via in `pyproject.toml`
- use `config.stub_path` for all-stubs
- use typed config
- use configured repo path everywhere

## 20.3 `stubber cli`

- use `-t` for `--tag`
- make `VERSION_LIST` robust
- gracefully handle get tags from non-existent folder
- use dynamic version list
- add git switch

## 20.4 common:

- basicgit: accept Paths
- add checkout version, refactor config and version
- refactor postprocessing

## 20.5 Github Actions

wf: run stubber clone before tests

## V1.6.3 MINOR CLEANUPS

### 21.1 cli:

- improve help
- add update-fallback to cli
- update toml with config
- refactor functions from cli to utils
- refactor utils
- use repo path
- default clone to repos folder
- add version and logging control
- change cmd `init` to `clone`

### 21.2 Tests

- testspace: change codecov report type
- refactor and improve tests & mocks

### 21.3 Developing:

devcontainer: add git graph extension

## NAMING CONVENTION

- use {family}-v{version}-{port} notation across all scripts and tools
- updated documentation accordingly
- single function to handle version names in various formats (clean\_version)
- requirements: pin dependencies to avoid differences when running across multiple machines.
- get\_mpy\_frozen:
  - refactor module
  - checkout the matching commit of micropython-lib without this it is not possible to build stubs older versions due to a restructure of micropython-lib
- bulk\_stubber:
  - make more robust by including dependencies in the project.
  - detect pyboard based on USB VID & PID
  - prep autostubber for pybv11
- manifest.json generation
  - improve core manifest.json information
  - improve support for grouping and sorting

### 23.1 stubber cli:

- add init test & refactor imports
- fix tests
- merge docstubs into stubber
- reduce tests
- merge get-all-stubs into stubber
- merge get\_all\_stubs into stubber
- add init
- add stub and some tests
- refactor minify and add -all option

## 23.2 config

- change to use module tomli(b)

## 23.3 common:

- update pyright config to reduce noise

## 23.4 firmware stubber

fw-stubber: clean up excepts

## 23.5 Documentation

docs: fix tomllib docs: document the CLI for stubber using sphinx-click readme: add badges for pypi and codecov doc updates fix docbuild for poetry update todos in source

docstubs: fix json import fix: black formatting across platforms

add settings and script for coverage reporting update snippets (origin/dev/snippets) snippets:add checks

Develop: fix: codespace poetry setup

#test test: fix fewer arguments tests: add firmware stubber version tests test: add missing toml test: add package == version == firmware stubber version tests test: basicgit - add mocktest git test: fix minify test remove unused imports

## 23.6 Github Actions:

wf: use poetry run and poetry install

pkg: updates to support poetry wf: poetry install verbose pkg: update actions to work with poetry pkg: Move all stubber files into module folder pkg: get version from poetry package pkg: move csv into package config: remove pylance config from vscode settings pkg: add data files

## USE POETRY

### 24.1 Dependencies

- bump distro from 1.6.0 to 1.7.0
- bump pytest from 6.2.5 to 7.0.1
- bump myst-parser from 0.16.1 to 0.17.0
- bump coverage from 6.3 to 6.3.1
- bump black from 21.12b0 to 22.1.0
- bump libbest from 0.3.23 to 0.4.1
- bump pytest-mock from 3.6.1 to 3.7.0
- bump mpy-cross from 1.17 to 1.18

### 24.2 documentation

- Add notes to docstrings/descriptions
- (bluetooth\_constants) doc: configure submodules
- docs: add open in VSCode banner
- textual and updates to version notation
- Update 40\_firmware\_stubs.md

### 24.3 docstubs:

- fix optional - Optional Parameters are not treated as optional <https://github.com/Josverl/micropython-stubber/issues/183>
- add docstubs validation
- skip 3 stubs.
- create umodules <https://github.com/Josverl/micropython-stubber/issues/176>
- align to micropython PR and update tests
- workaround for re.Match and smarter tests

- fix module & Class constant handling & tests
- Add = ... to module and class level constants to avoid errors when they are used as a default value in function of method

## 24.4 scripts:

- script update\_modulelist, - write updates to: - board/modulelist.txt - board/createsubs.py
- bulk\_stubber: Copy generated/firmwarestubs to all-stubs/\* use firmware-stubs path for temp storage
- Update BulkStubber & getserial for esp32, esp8266 and stm32
- minify.py: posix paths
- bulkstubber: more versions

## 24.5 Common

- improve black formatting for subfolders
- utils: do not use BaseException
- config: pycache
- data: add firmware modules
- Multi-root with mpy-stdlib based on pico-go
- utils.stubgen: re-apply refactor to avoid use of os.cmd or subprocess.run
- utils.stubgen: refactor to avoid use of os.cmd or subprocess.run

## 24.6 Validation

- add snippets to test mpy stdlib
- validation: Add more snippets
- update validation snippets
- WS with pyright snippets

## 24.7 Github Actions:

- wf: do not run minified tests twice, minify all

## 24.8 Developing:

devcontainer: also init git submodules devcontainer: change python setup

## 24.9 Tests

test: fix test\_socket \_class test: fix return type and test deepsleep test: skip test\_createstubs on windows + python 3.7  
test: native test on windows, include db test on linux test: add createstubs\_db on all platforms test: lower threshold to 25  
stubs test: add native integration test for micropython\_mem test: linux rest on ubuntu and debian, separate branch / fail  
logic in docstubs test test: add additional firmwares test: waste less time in by reducing test size test: remove path test  
debug: fix debug config for tests debug: add missing debug property test: fix pessimistic test and make more robust

## CREATESUBS V1.5.4

Better exeptions fix missed updates to mem and stub variants

### 25.1 Change naming convention:

- board: user {family}-v{version}-{port} notation
- change name of master branch to main

### 25.2 stubber cli

- fix: - rp2.PIO.irq
- fix dequeue
- revert re.match change
- fixup re.match
- add fixes for remaining Documentation errors
- generate Exception Classes
- fix test and default for machine.Pin.**init**
- fix 3 Non-default argument follows default argument errors
- run pyflake to remove unused imports
- fix black parameters
- no need to redefine Exception
- use 'Latest' as a version tag for the most recent master
- use v for version

## 25.3 Common

- pyright: restore exec environments test & board
- get\_frozen: improve force **init.py**
- get\_frozen: run black on new/updated stubs
- createstubs: support for RP2 , and accept kwargs for methods and functions
- lobo: skip some modules
- get\_mpy: match\_lib - add v1.18 rename to .csv
- version: latest
- basicgit: remove debugging code
- basicgit: fix gettag 'latest'
- bulk\_stubber: make more robust by adding the dependencies to the repo
- get\_frozen: clean collected modules - freeze to empty directory - block CI/CD manifest
- get\_mpy: for frozen modules: checkout the matching commit of micropython-lib
- mpy\_frozen: refactor module
- process: --source allows scriptname to be specified & add mpy-cross step
- update\_pyi : rename and more efficient updating find .pyi`s created in the wrong location and move them
- Manifest: release is optional
- use **version** and bump version
- get\_mpy: improve porcessing of frozen modules V1.16 and newer
- schema: change stubtype property
- Module manifest: Sorting and add port name
- update get-frozen
- improve frozen manifest processing (#88)
- utils: update clean version
- createstubs\* : Add stubtype to manifest - remove redundant try/catch
- process.py: cleanup unused variables
- process.py: use click

## 25.4 scripts

- add scripts to simplify copy and updates
- Merge generate stubs from documentation

## 25.5 Firmware stubber

- createstubs: sample bootfile works on pyb & esp
- createstubs: get\_root can detect /sd cards

## 25.6 Dependencies

- python requirements: pin versions
- bump coverage from 6.2 to 6.3
- bump sphinx from 4.3.2 to 4.4.0
- add autoflake
- bump mpy-cross from 1.16 to 1.17
- bump myst-parser from 0.15.2 to 0.16.1
- bump mypy from 0.930 to 0.931
- bump sphinx from 4.3.1 to 4.3.2
- bump rshell from 0.0.30 to 0.0.31

## 25.7 Documentation

- docs: update naming convention
- fix stuborder image
- Update 10\_approach.md
- Naming convention
- one less
- add branch rename instructions
- documented Docs to Stubs process

## 25.8 validation

- basic setup for stub validation
- add code snippets for validation

## 25.9 BugFixes:

- fix: ensure that `from __future__` ... is at start
- add .pyi stubs for umqtt.robust Workaround for missing `init.py` in source
- fix: allow stubgen of async yield in stub (python 3.6) closes #137
- fix Exception lineskip
- fix: get\_mpy - save&resore cwd
- fix lobotest to match reduced modules
- Fix core module sort order closes #68

## 25.10 Github Actions:

- wf test: ensure artefact upload on error
- wf: report coverage
- testspace: use folders
- pytest: upload to testspace
- wf: allign naming

## 25.11 Scripts:

- prep autostubber for pybv11
- detect pyboard

## 25.12 code quality:

- fix warnings
- improve core manifest.json

## 25.13 Tests

- test: fix testregression for latest version
- tests: docstubs improve test of class documented as function
- testspace script
- test: add mpy-cross test and split to seperate folder
- improve grouping
- pytest - use matrix.os in test results
- test: do not run pytest-cov

- tests: drop utf-8 encoding
- test : init logging
- test : fix path
- test: stabelize pyright & black detection
- tests: skip basicgit tests
- add integration tests for cmdline

## IMPROVE DOCSTUBS

- rst: cleaner import though use of **all**
- document: debug subprocess
- docstubs: fix random.choice(): Any
- docstubs: workaround black on Py3.7

### 26.1 common:

- add header to modulelist
- devcontainer: simpler requirements
- utils: fix generating .pyi files from .py files with errors
- fix: remove duplication fix minor issues
- github: group logging

## TESTS

- pin python version
- pytest: add test markers
- change ubuntu version detection to codename
- add mark.minified to linux tests add new platform markers
- implement workaround for failing minified tests
- tests: restructure board test to share testdata
- add debug config
- tests: fix minified tests
- tests: improve & merge testing
- test: linux detection++
- tests: use pathlib and fix paths
- clarify intentional error
- remove duplicate tests
- tests: Restructure Micropython on Cpython tests
- tests: resolve issues due to sloppy imports in tests
- stubgen test : add logging for python 3.7

### 27.1 minify:

- minify all variants
- also remove `_log *` lines
- also: minimize `createtubs_mem.py`
- Fix: remove duplicate builtins from minified
- minify : fix mpy-cross on Python 3.7

## 27.2 createstubs:

- add normal and mem\_constrained versions
- add database variant
- Save state to database and reboot on memory error
- reduce complexity from createstubs to save ram possibly loosing some edge cases ++ docs
- update to handle multi-file uploads to overcome esp8266 memory constraints
- both normal and db work on esp8266 (report not done)
- keep get\_root and \_info to allow for testing
- update tests to clean-up sys.path after the tests
- keep **version** in minified
- use **version** move unneeded import of machine
- gracefully handle missing modules.txt
- stubber: fix firmwareid for mpy esp8266
- stub\_lvgl: fix **version**

## 27.3 Github Actions:

- use posix path
- workflow: test : on checkout fetch all branches and tags

## 27.4 Docs:

- do not keep generated API Docs
- refactor documentation to more docs
- add explanation om memory optimization.
- add cloning of submodules
- safer path insertion

## 27.5 Other :

- add remote\_stubber script
- bulk\_stubber: run black formatter after all downloads
- remote\_stubber: improve reporting
- bulk stubber: make esp8266 work more reliable ESP32 WIP - scrips fail to upload

## CREATESTUBS: V1.5.1

- `get_root` can detect /sd cards
- sample bootfile works on pyb1.1, esp323, esp8266

### 28.1 Documentation Stubs

- avoid the use of `BaseException`

### 28.2 `createstubs.py` - v1.4.3

- significant memory optimisation for use on low-memory devices such as the esp8266 family
  - load the list of modules to be stubbed from a text file rather than as part of the source
  - use both minification and the `mpy-cross` compiler to reduce the claim on memory (RAM)

**Warning:** This is a potential breaking change for external tools that expect to either directly execute the script or upload only a single file to an MCU in order to stub.

- the current process is automated in ``remote_stubber.ps1``

### 28.3 `createstubs.py` - v1.4.2

- Fixes a regression introduced in 1.4-beta where function definitions would include a `self` parameter.

### 28.4 minified `createstubs.py` - v1.4.1

- Switched to use `python-minifier` for the minification due to the end-of-life of the previous minification tool The new minification tool produces more compact code, although that is still not sufficient for some memory constrained devices.
  - there are no functional changes,
  - the detection of Micropython was adjusted to avoid the use of `eval` which blocked a minification rule
  - several tests were adjusted

## 28.5 documentation

- Add Sphinx documentation
  - changelog
  - automatic API documentation for
    - \* createstubs.py (board)
    - \* scripts to run on PC / Github actions
- Publish documentation to readthedocs

## 28.6 createstubs - v1.4-beta

- createstubs.py
  - improvements to handle nested classes to be able to create stubs for lvgl. this should also benefit other more complex modules.
- added `stub_lvgl.py` helper script

## 28.7 createstubs.py - v1.3.16

- createstubs.py
  - fix for micropython v1.16
  - skip `_test` modules in module list
  - black formatting
  - addition of **init** methods ( based on runtime / static)
  - class method decorator
  - additional type information for constants using comment style typing
  - detect if running on MicroPython or CPython
  - improve report formatting to list each module on a separate line to allow for better comparison
- workflows
  - move to ubuntu 20.04
    - \* move to `test/tools/ubuntu_20_04/micropython_v1.xx`
  - run more tests in GHA
- postprocessing
  - minification adjusted to work with **black**
  - use `mypy.stubgen`
  - run per folder
    - \* verify 1:1 relation `.py-.pyi`
    - \* run `mypy.stubgen` to generate missing `.pyi` files

- publish test results to GH
- develop / repo setup
  - updated dev requirements (requirements-dev.txt)
  - enable developing on [GitHub codespaces](#)
  - switched to using submodules to remove external dependencies how to clone : `git submodule init git submodule update`
  - added black configuration file to avoid running black on minified version
  - switched to using .venv on all platforms
  - added and improved tests
    - \* test coverage increased to 82%
  - move to test/tools/ubuntu\_20\_04/micropython\_v1.xx
    - \* for test (git workflows)
    - \* for tasks
  - make use of CPYTHON stubs to alle makestubs to run well on CPYTHON
    - \* allows pytest, and debugging of tests
  - add tasks to :
    - \* run createstubs in linux version

**TO-DO (PROVISIONAL)**

## UPSTREAM DOCUMENTATION

in docstubs:

### 30.1 ifconfig

in order to accept `ifconfig()` without any parameters from `: configtuple: Optional[Any]` to `: configtuple: Optional[Tuple] = None`

### 30.2 ap.config

from: `def config(self, param) -> Any:` to: `def config(self, param:str="", **kwargs) -> Any:`

### 30.3 write\_pulses

Argument of type `"Literal[0]"` cannot be assigned to parameter `"data"` of type `"bool"` in function `"write_pulses"` `"Literal[0]"` is incompatible with `"bool"`

from: `def write_pulses(self, duration, data=True) -> Any:` to: `def write_pulses(self, duration:Union[List, Tuple], data:int=1) -> None:`

or even better an overload

```
@overload
def write_pulses(self, duration:Union[List, Tuple], data:int=1) -> None:
    ...
@overload
def write_pulses(self, duration:int, data: Union[List, Tuple]) -> None:
    ...
def write_pulses(self, duration:Union[List, Tuple], data:Union[List, Tuple]) -> None:
```

## 30.4 working on it

### 30.4.1 documentation

- how to run post-processing
- how the debug setup works

### 30.4.2 stubber :

- document - that gc and sys modules are somehow ignored by pylint and will keep throwing errors
- add mpy information to manifest
- use 'nightly' naming convention in createstubs.py
- change firmware naming

### 30.4.3 frozen stubs

- add simple readme.md ?

### 30.4.4 Stub augmentation/ merging typeinformation from copied / generated type-rich info

<https://libcst.readthedocs.io/en/latest/tutorial.html>

- test to auto-merge common prototypes by stubber ie. add common return types to make\_stub\_files.cfg

### 30.4.5 Webrepl

Unable to import 'webrepl' can include in common modules C:\develop\MyPython\micropython\extmod\webrepl\webrepl.py

## 31.1 Cloning the repo

```
git clone https://github.com/Josverl/micropython-stubber.git
cd micropython-stubber

poetry install --with dev --with docs
stubber clone
```

## 31.2 Windows 10

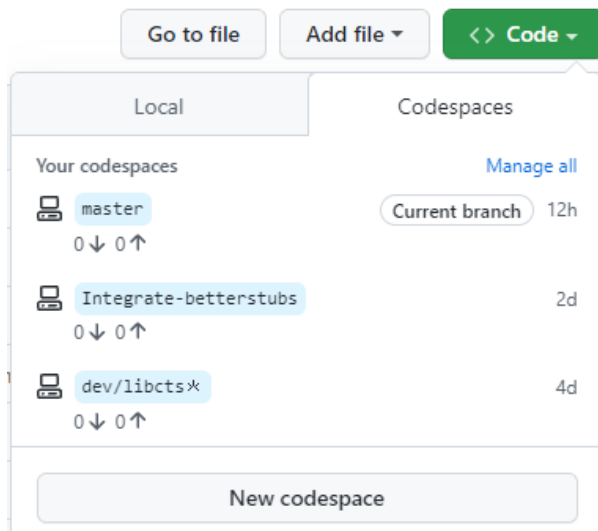

I use Windows 10/11 and use WSL2 to run the linux based parts. if you develop on other platform, it is quite likely that you may need to change some details. if that is needed , please update/add to the documentation and send a documentation PR.

- clone
- create python virtual environment (optional)
- install requirements-dev
- setup sister repos
- run test to verify setup

## 31.3 Github codespaces

Is is also possible to start a pre-configure development environment in [GitHub Codespaces](#) this is probably the fastest and quickest way to start developing.

Note that Codespaces is currently in an extended beta.

## 31.4 Wrestling with two pythons

This project combines CPython and MicroPython in one project. As a result you may/will need to switch the configuration of pylint and VSCode to match the section of code that you are working on. This is caused by the fact that pylint does not support per-folder configuration

to help switching there are 2 different .pylintrc files stored in the root of the project to simplify switching.

Similar changes will need to be done to the .vscode/settings.json

If / when we can get pylance to work with the micropython stubs , this may become simpler as Pylance natively supports [multi-root workspaces](#), meaning that you can open multiple folders in the same Visual Studio Code session and have Pylance functionality in each folder.

## 31.5 Minification

If you make changes to the createstubs.py script , you should also update the minified version by running `python process.py minify` at some point.

If you forget to do this there is a github action that should do this for you and create a PR for your branch.

## 31.6 Testing

MicroPython-Stubber has a number of tests written in Pytest

see below overview

folder	what	how	used where
board	createstubs.pynormal & minified	runs createstubs.py on micropython-linux ports	WSL2 and github actions
check-out_repo	simple_git mod-uleretrieval of frozen modules	does not use mocking but actually retrieves different firmware versions locally using git or downNloads modules for online	local win-dows
com-mon	all other tests	common	local + github action

**Note:** Also see [test documentation](#)

**Platform detection to support pytest** In order to allow both simple usability om MicroPython and testability on Full Python, createstubs does a runtime test to determine the actual platform it is running on while importing the module This is similar to using the `if __name__ == "__main__":` preamble If running on MicroPython, then it starts stubbing

```
if isMicroPython():
    main()
```

**Testing on micropython linux port(s)** In order to be able to test createstubs.py, it has been updated to run on linux, and accept a `-path` parameter to indicate the path where the stubs should be stored.

## 31.7 Debugging Cpython code that run Micropython

Some of the test code run the micropython executable using `subprocess.run()`. When you try to debug these tests the VSCode debugger (debugpy)(<https://github.com/microsoft/debugpy>) then tries to attach to that micropython subprocess in order to facilitate debugging. This will fail as reported in this [issue](#).

The solution to this problem is to disable subprocess debugging using the `"subProcess": false` switch.

```
// launch.json
{
  // disable pytest coverage report as it conflicts with debugging tests
  "name": "Debug pytest tests",
  "type": "python",
  "purpose": [
    "debug-test"
  ],
  "console": "integratedTerminal",
  "justMyCode": false,
  "stopOnEntry": false,
  "subProcess": false, // Avoid debugpy trying to debug micropython
  "env": {
    "PYTEST_ADDDOPTS": "--no-cov"
  }
},
```

## 31.8 github actions

### 31.8.1 pytests.yml

This workflow will :

- test the workstation scripts
- test the createstubs.py script on multiple micropython linux versions
- test the minified createstubs.py script on multiple micropython linux versions

### 31.8.2 run minify-pr.yml

This workflow will :

- create a minified version of createstubs.py
- run a quick test on that
- and submit a PR to the branch -minify

## TESTING

A significant number of tests have been created in pytest.

- The tests are located in the `tests` folder.
- The `tests/data` folder contains folders with subs that are used to verify the correct working of the minification modules
- debugging the tests only works if `--no-cov` is specified for pytest

### 32.1 testing & debugging `createstubs.py`

- the `tests\mocks` folder contains mock-modules that allow the micropython code to be run in CPython. This is used by the unit tests that verify `createstubs.py` and its minified version.
- in order to load / debug the test the python path needs to include the `cpython_core` modules (Q&D)
- mocking `cpython_core/os` is missing the implementation attribute so that has been added (Q&D)

### 32.2 platform detection

In order to allow both simple usability on MicroPython and testability on *full* Python, `createstubs` does a runtime test to determine the actual platform it is running on while importing the module

This is similar to using the `if __name__ == "__main__":` preamble

```
if isMicroPython():  
    main()
```

This allows pytest test running on full Python to import `createstubs.py` and run tests against individual methods, while allowing the script to run directly on import on a MicroPython board.

---

**Note:** Some test are platform dependent and have been marked to only run on linux or windows

---

## 32.3 Code Coverage

Code coverage is measured and reported in the `coverage/index.html` report. This report is not checked in to the repo, and therefore is only

## API REFERENCE

This page contains auto-generated API reference documentation<sup>1</sup>.

### 33.1 createstubs

Create stubs for (all) modules on a MicroPython board

#### 33.1.1 Module Contents

##### Classes

<i>Stubber</i>	Generate stubs for modules in firmware
----------------	--

##### Functions

<i>ensure_folder</i> (path)	Create nested folders if needed
<i>_info</i> ()	collect base information on this runtime
<i>extract_os_info</i> (info)	get info from os.uname()
<i>get_root</i> (→ str)	Determine the root folder of the device
<i>file_exists</i> (filename)	
<i>show_help</i> ()	
<i>read_path</i> (→ str)	get --path from cmdline. [unix/win]
<i>is_micropython</i> (→ bool)	runtime test to determine full or micropython
<i>main</i> ()	

---

<sup>1</sup> Created with sphinx-autoapi

## Attributes

`__version__`

`ENOENT`

`_MAX_CLASS_LEVEL`

`_log`

`createstubs.__version__ = 1.11.2`

`createstubs.ENOENT = 2`

`createstubs._MAX_CLASS_LEVEL = 2`

**class** `createstubs.Stubber`(*path*: *str* = None, *firmware\_id*: *str* = None)

Generate stubs for modules in firmware

### Parameters

- `path` (*str*) –
- `firmware_id` (*str*) –

**get\_obj\_attributes**(*item\_instance*: *object*)

extract information of the objects members and attributes

### Parameters

- `item_instance` (*object*) –

**add\_modules**(*modules*)

Add additional modules to be exported

**create\_all\_stubs**()

Create stubs for all configured modules

**create\_one\_stub**(*module\_name*: *str*)

### Parameters

- `module_name` (*str*) –

**create\_module\_stub**(*module\_name*: *str*, *file\_name*: *str* = None) → *bool*

Create a Stub of a single python module

Args: - `module_name` (*str*): name of the module to document. This module will be imported. - `file_name` (Optional[*str*]): the 'path/filename.py' to write to. If omitted will be created based on the module name.

### Parameters

- `module_name` (*str*) –
- `file_name` (*str*) –

### Return type

*bool*

**write\_object\_stub**(*fp*, *object\_expr*: *object*, *obj\_name*: *str*, *indent*: *str*, *in\_class*: *int* = 0)

Write a module/object stub to an open file. Can be called recursive.

**Parameters**

- **object\_expr** (*object*) –
- **obj\_name** (*str*) –
- **indent** (*str*) –
- **in\_class** (*int*) –

**clean**(*path*: *str* = None)

Remove all files from the stub folder

**Parameters**

**path** (*str*) –

**report**(*filename*: *str* = 'modules.json')

create json with list of exported modules

**Parameters**

**filename** (*str*) –

**write\_json\_node**(*f*)

**createstubs.ensure\_folder**(*path*: *str*)

Create nested folders if needed

**Parameters**

**path** (*str*) –

**createstubs.\_info**()

collect base information on this runtime

**createstubs.extract\_os\_info**(*info*)

get info from os.uname()

**createstubs.get\_root**() → *str*

Determine the root folder of the device

**Return type**

*str*

**createstubs.file\_exists**(*filename*: *str*)

**Parameters**

**filename** (*str*) –

**createstubs.show\_help**()

**createstubs.read\_path**() → *str*

get -path from cmdline. [unix/win]

**Return type**

*str*

**createstubs.is\_micropython**() → *bool*

runtime test to determine full or micropython

**Return type**

*bool*

```
createstubs.main()
createstubs._log
```

## 33.2 createstubs\_db

Create stubs for (all) modules on a MicroPython board.

This variant of the createstubs.py script is optimized for use on very-low-memory devices. Note: this version has undergone limited testing.

- 1) reads the list of modules from a text file *./modulelist.txt* that should be uploaded to the device.
- 2) stored the already processed modules in a text file *./modulelist.done*
- 3) **process the modules in the database:**
  - stub the module
  - update the modulelist.done file
  - reboots the device if it runs out of memory
- 4) creates the modules.json

If that cannot be found then only a single module (micropython) is stubbed. In order to run this on low-memory devices two additional steps are recommended: - minification, using python-minifierto reduce overall size, and remove logging overhead. - cross compilation, using mpy-cross, to avoid the compilation step on the micropython device

You should find a cross-compiled version located here: `./minified/createstubs_db.mpy`

### 33.2.1 Module Contents

#### Classes

<i>Stubber</i>	Generate stubs for modules in firmware
----------------	--

#### Functions

<i>ensure_folder</i> (path)	Create nested folders if needed
<i>_info</i> ()	collect base information on this runtime
<i>get_root</i> (→ str)	Determine the root folder of the device
<i>file_exists</i> (filename)	
<i>show_help</i> ()	
<i>read_path</i> (→ str)	get --path from cmdline. [unix/win]
<i>is_micropython</i> (→ bool)	runtime test to determine full or micropython
<i>main_esp8266</i> ()	

## Attributes

`__version__`

`ENOENT`

`_MAX_CLASS_LEVEL`

`_log`

```
createstubs_db.__version__ = 1.11.2
```

```
createstubs_db.ENOENT = 2
```

```
createstubs_db._MAX_CLASS_LEVEL = 2
```

```
class createstubs_db.Stubber(path: str = None, firmware_id: str = None)
```

Generate stubs for modules in firmware

### Parameters

- `path` (*str*) –
- `firmware_id` (*str*) –

```
get_obj_attributes(item_instance: object)
```

extract information of the objects members and attributes

### Parameters

- `item_instance` (*object*) –

```
add_modules(modules)
```

Add additional modules to be exported

```
create_all_stubs()
```

Create stubs for all configured modules

```
create_one_stub(module_name: str)
```

### Parameters

- `module_name` (*str*) –

```
create_module_stub(module_name: str, file_name: str = None) → bool
```

Create a Stub of a single python module

Args: - `module_name` (*str*): name of the module to document. This module will be imported. - `file_name` (Optional[*str*]): the 'path/filename.py' to write to. If omitted will be created based on the module name.

### Parameters

- `module_name` (*str*) –
- `file_name` (*str*) –

### Return type

*bool*

**write\_object\_stub**(*fp*, *object\_expr*: *object*, *obj\_name*: *str*, *indent*: *str*, *in\_class*: *int* = 0)

Write a module/object stub to an open file. Can be called recursive.

**Parameters**

- **object\_expr** (*object*) –
- **obj\_name** (*str*) –
- **indent** (*str*) –
- **in\_class** (*int*) –

**clean**(*path*: *str* = None)

Remove all files from the stub folder

**Parameters**

**path** (*str*) –

**report**(*filename*: *str* = 'modules.json')

create json with list of exported modules

**Parameters**

**filename** (*str*) –

**createstubs\_db.ensure\_folder**(*path*: *str*)

Create nested folders if needed

**Parameters**

**path** (*str*) –

**createstubs\_db.\_info**()

collect base information on this runtime

**createstubs\_db.get\_root**() → *str*

Determine the root folder of the device

**Return type**

*str*

**createstubs\_db.file\_exists**(*filename*: *str*)

**Parameters**

**filename** (*str*) –

**createstubs\_db.show\_help**()

**createstubs\_db.read\_path**() → *str*

get -path from cmdline. [unix/win]

**Return type**

*str*

**createstubs\_db.is\_micropython**() → *bool*

runtime test to determine full or micropython

**Return type**

*bool*

**createstubs\_db.main\_esp8266**()

**createstubs\_db.\_log**

## 33.3 createstubs\_mem

Create stubs for (all) modules on a MicroPython board.

This variant of the createstubs.py script is optimised for use on low-memory devices, and reads the list of modules from a text file `./modulelist.txt` that should be uploaded to the device. If that cannot be found then only a single module (micropython) is stubbed. In order to run this on low-memory devices two additional steps are recommended: - minification, using python-minifier

to reduce overall size, and remove logging overhead.

- cross compilation, using mpy-cross, to avoid the compilation step on the micropython device

you can find a cross-compiled version located here: `./minified/createstubs_mem.mpy`

### 33.3.1 Module Contents

#### Classes

<i>Stubber</i>	Generate stubs for modules in firmware
----------------	--

#### Functions

<i>ensure_folder</i> (path)	Create nested folders if needed
<i>_info</i> ()	collect base information on this runtime
<i>get_root</i> (→ str)	Determine the root folder of the device
<i>file_exists</i> (filename)	
<i>show_help</i> ()	
<i>read_path</i> (→ str)	get --path from cmdline. [unix/win]
<i>is_micropython</i> (→ bool)	runtime test to determine full or micropython
<i>main</i> ()	

#### Attributes

<i>__version__</i>
<i>ENOENT</i>
<i>_MAX_CLASS_LEVEL</i>
<i>_log</i>

`createstubs_mem.__version__ = 1.11.2`

`createstubs_mem.ENOENT = 2`

`createstubs_mem._MAX_CLASS_LEVEL = 2`

**class** `createstubs_mem.Stubber`(*path*: *str* = None, *firmware\_id*: *str* = None)

Generate stubs for modules in firmware

**Parameters**

- **path** (*str*) –
- **firmware\_id** (*str*) –

**get\_obj\_attributes**(*item\_instance*: *object*)

extract information of the objects members and attributes

**Parameters**

- item\_instance** (*object*) –

**add\_modules**(*modules*)

Add additional modules to be exported

**create\_all\_stubs**()

Create stubs for all configured modules

**create\_one\_stub**(*module\_name*: *str*)

**Parameters**

- module\_name** (*str*) –

**create\_module\_stub**(*module\_name*: *str*, *file\_name*: *str* = None) → bool

Create a Stub of a single python module

Args: - *module\_name* (*str*): name of the module to document. This module will be imported. - *file\_name* (Optional[*str*]): the 'path/filename.py' to write to. If omitted will be created based on the module name.

**Parameters**

- **module\_name** (*str*) –
- **file\_name** (*str*) –

**Return type**

bool

**write\_object\_stub**(*fp*, *object\_expr*: *object*, *obj\_name*: *str*, *indent*: *str*, *in\_class*: *int* = 0)

Write a module/object stub to an open file. Can be called recursive.

**Parameters**

- **object\_expr** (*object*) –
- **obj\_name** (*str*) –
- **indent** (*str*) –
- **in\_class** (*int*) –

**clean**(*path*: *str* = None)

Remove all files from the stub folder

**Parameters**

- path** (*str*) –

**report**(filename: *str* = 'modules.json')

create json with list of exported modules

**Parameters**

**filename** (*str*) –

createstubs\_mem.**ensure\_folder**(path: *str*)

Create nested folders if needed

**Parameters**

**path** (*str*) –

createstubs\_mem.**\_info**()

collect base information on this runtime

createstubs\_mem.**get\_root**() → *str*

Determine the root folder of the device

**Return type**

*str*

createstubs\_mem.**file\_exists**(filename: *str*)

**Parameters**

**filename** (*str*) –

createstubs\_mem.**show\_help**()

createstubs\_mem.**read\_path**() → *str*

get -path from cmdline. [unix/win]

**Return type**

*str*

createstubs\_mem.**is\_micropython**() → *bool*

runtime test to determine full or micropython

**Return type**

*bool*

createstubs\_mem.**main**()

createstubs\_mem.**\_log**

## 33.4 stub\_lvgl

Helper module to create stubs for the lvgl modules. Note that the stubs can be very large, and it may be best to directly store them on an SD card if your device supports this.

## 33.4.1 Module Contents

### Functions

<code>main()</code>	Create stubs for the lvgl modules using the lvlg version number.
---------------------	--

`stub_lvgl.main()`  
Create stubs for the lvgl modules using the lvlg version number.

## 33.5 stubber

read the version from pyproject or the wheels

### 33.5.1 Subpackages

`stubber.codemod`

#### Submodules

`stubber.codemod.add_comment`

Add comment(s) to each file

### Module Contents

#### Classes

<code>AddComment</code>	A command that acts identically to a visitor-based transform, but also has
-------------------------	--

**class** `stubber.codemod.add_comment.AddComment`(*context: libcst.codemod.CodemodContext, comments: List[str]*)

Bases: `libcst.codemod.VisitorBasedCodemodCommand`

A command that acts identically to a visitor-based transform, but also has the support of `add_args()` and running supported helper transforms after execution. See `CodemodCommand` and `ContextAwareTransformer` for additional documentation.

#### Parameters

- **context** (*libcst.codemod.CodemodContext*) –
- **comments** (*List[str]*) –

**DESCRIPTION** :str = Add comment(s) to each file

**static add\_args**(*arg\_parser: argparse.ArgumentParser*) → None

Add command-line args that a user can specify for running this codemod.

**Parameters**

**arg\_parser** (*argparse.ArgumentParser*) –

**Return type**

None

**visit\_Comment**(*node: libcst.Comment*) → None

connect comments from the source

**Parameters**

**node** (*libcst.Comment*) –

**Return type**

None

**leave\_Module**(*original\_node: libcst.Module, updated\_node: libcst.Module*) → libcst.Module

If the tag already exists, don't modify the file.

**Parameters**

• **original\_node** (*libcst.Module*) –

• **updated\_node** (*libcst.Module*) –

**Return type**

libcst.Module

`stubber.codemod.enrich`

## Module Contents

### Functions

<code>enrich_file</code> (→ Optional[str])	Enrich a firmware stubs using the doc-stubs in another folder.
<code>enrich_folder</code> (→ int)	Enrich a folder with containing firmware stubs using the doc-stubs in another folder.

`stubber.codemod.enrich.enrich_file`(*target\_path: pathlib.Path, docstub\_path: pathlib.Path, diff=False, write\_back=False*) → str | None

Enrich a firmware stubs using the doc-stubs in another folder. Both (.py or .pyi) files are supported.

**Parameters**

- **source\_path** – the path to the firmware stub to enrich
- **docstub\_path** (*pathlib.Path*) – the path to the folder containing the doc-stubs
- **diff** – if True, return the diff between the original and the enriched source file
- **write\_back** – if True, write the enriched source file back to the source\_path
- **target\_path** (*pathlib.Path*) –

**Return type**

Optional[str]

Returns: - None or a string containing the diff between the original and the enriched source file

`stubber.codemod.enrich.enrich_folder`(*source\_folder*: *pathlib.Path*, *docstub\_path*: *pathlib.Path*,  
*show\_diff*=False, *write\_back*=False, *require\_docstub*=False) → int

Enrich a folder with containing firmware stubs using the doc-stubs in another folder.

Returns the number of files enriched.

**Parameters**

- **source\_folder** (*pathlib.Path*) –
- **docstub\_path** (*pathlib.Path*) –

**Return type**

int

**stubber.codemod.merge\_docstub**

Merge documentation and type information from from the docstubs into a board stub

## Module Contents

### Classes

<i>MergeCommand</i>	A libcst transformer that merges the type-rich information from a doc-stub into
---------------------	---

**class** `stubber.codemod.merge_docstub.MergeCommand`(*context*: *libcst.codemod.CodemodContext*, *stub\_file*:  
*pathlib.Path* | *str*)

Bases: `libcst.codemod.VisitorBasedCodemodCommand`

A libcst transformer that merges the type-rich information from a doc-stub into a firmware stub. The resulting file will contain information from both sources.

- module docstring - from source
- function parameters and types - from docstubs
- function return types - from docstubs
- function docstrings - from source

**Parameters**

- **context** (*libcst.codemod.CodemodContext*) –
- **stub\_file** (*Union[pathlib.Path, str]*) –

**DESCRIPTION** :str = Merge the type-rich information from a doc-stub into a firmware stub

**static add\_args**(*arg\_parser*: *argparse.ArgumentParser*) → *None*

Add command-line args that a user can specify for running this codemod.

**Parameters**

**arg\_parser** (*argparse.ArgumentParser*) –

**Return type**

*None*

**leave\_Module**(*original\_node*: *libcst.Module*, *updated\_node*: *libcst.Module*) → *libcst.Module*

Update the Module docstring

**Parameters**

• **original\_node** (*libcst.Module*) –

• **updated\_node** (*libcst.Module*) –

**Return type**

*libcst.Module*

**visit\_ClassDef**(*node*: *libcst.ClassDef*) → *bool* | *None*

keep track of the the (class, method) names to the stack

**Parameters**

**node** (*libcst.ClassDef*) –

**Return type**

Optional[*bool*]

**leave\_ClassDef**(*original\_node*: *libcst.ClassDef*, *updated\_node*: *libcst.ClassDef*) → *libcst.ClassDef*

**Parameters**

• **original\_node** (*libcst.ClassDef*) –

• **updated\_node** (*libcst.ClassDef*) –

**Return type**

*libcst.ClassDef*

**visit\_FunctionDef**(*node*: *libcst.FunctionDef*) → *bool* | *None*

**Parameters**

**node** (*libcst.FunctionDef*) –

**Return type**

Optional[*bool*]

**leave\_FunctionDef**(*original\_node*: *libcst.FunctionDef*, *updated\_node*: *libcst.FunctionDef*) →  
*libcst.FunctionDef* | *libcst.ClassDef*

Update the function Parameters and return type, decorators and docstring

**Parameters**

• **original\_node** (*libcst.FunctionDef*) –

• **updated\_node** (*libcst.FunctionDef*) –

**Return type**

Union[*libcst.FunctionDef*, *libcst.ClassDef*]

`stubber.commands`

## Submodules

`stubber.commands.build_cmd`

Build stub packages - is a Light version of Publish command

## Module Contents

### Functions

---

<code>cli_build</code> (family, versions, ports, boards, clean, force)	Commandline interface to publish stubs.
--	---

---

`stubber.commands.build_cmd.cli_build`(family: *str*, versions: *str* | *List[str]*, ports: *str* | *List[str]*, boards: *str* | *List[str]*, clean: *bool*, force: *bool*)

Commandline interface to publish stubs.

#### Parameters

- **family** (*str*) –
- **versions** (*Union[str, List[str]]*) –
- **ports** (*Union[str, List[str]]*) –
- **boards** (*Union[str, List[str]]*) –
- **clean** (*bool*) –
- **force** (*bool*) –

`stubber.commands.cli`

command line interface - main group

## Module Contents

### Functions

---

<code>stubber_cli</code> (→ None)
-----------------------------------

---

`stubber.commands.cli.stubber_cli`(ctx: *click.Context*, verbose: *int* = 0) → None

#### Parameters

- **ctx** (*click.Context*) –
- **verbose** (*int*) –

### Return type

None

## stubber.commands.clone\_cmd

Clone/fetch the micropython repos locally.

## Module Contents

### Functions

<code>cli_clone(path[, stubs])</code>	Clone/fetch the micropython repos locally.
---------------------------------------	--

stubber.commands.clone\_cmd.**cli\_clone**(*path*: *str* | *pathlib.Path*, *stubs*: *bool* = *False*)

Clone/fetch the micropython repos locally.

The local repos are used to generate frozen-stubs and doc-stubs.

#### Parameters

- **path** (*Union[str, pathlib.Path]*) –
- **stubs** (*bool*) –

## stubber.commands.config\_cmd

## Module Contents

### Functions

<code>cli_config()</code>	Show the current configuration
---------------------------	--------------------------------

stubber.commands.config\_cmd.**cli\_config**()

Show the current configuration

## stubber.commands.enrich\_folder\_cmd

enrich machinestubs with docstubs

## Module Contents

### Functions

---

<code>cli_enrich_folder</code>	<code>(stubs_folder, docstubs_folder[, ...])</code>	Enrich the stubs in <code>stub_folder</code> with the docstubs in <code>docstubs_folder</code> .
--------------------------------	---	--

---

```
stubber.commands.enrich_folder_cmd.cli_enrich_folder(stubs_folder: str | pathlib.Path,
                                                    docstubs_folder: str | pathlib.Path, diff=False,
                                                    dry_run=False)
```

Enrich the stubs in `stub_folder` with the docstubs in `docstubs_folder`.

#### Parameters

- **stubs\_folder** (`Union[str, pathlib.Path]`) –
- **docstubs\_folder** (`Union[str, pathlib.Path]`) –

`stubber.commands.get_core_cmd`

## Module Contents

### Functions

---

<code>cli_get_core</code>	<code>([stub_folder, pyi, black])</code>	Download core CPython stubs from PyPi.
---------------------------	--	--

---

```
stubber.commands.get_core_cmd.cli_get_core(stub_folder: str = CONFIG.stub_path.as_posix(), pyi: bool
                                           = True, black: bool = True)
```

Download core CPython stubs from PyPi.

Get the core (CPython compat) modules for both MicroPython and Pycopy.

#### Parameters

- **stub\_folder** (`str`) –
- **pyi** (`bool`) –
- **black** (`bool`) –

`stubber.commands.get_docstubs_cmd`

`get-docstubs`

## Module Contents

### Functions

---

<code>cli_docstubs</code> (ctx[, path, target, black, basename])	Build stubs from documentation.
--	---------------------------------

---

```
stubber.commands.get_docstubs_cmd.cli_docstubs(ctx, path: str = CONFIG.repo_path.as_posix(), target:
str = CONFIG.stub_path.as_posix(), black: bool =
True, basename='micropython')
```

Build stubs from documentation.

Read the Micropython library documentation files and use them to build stubs that can be used for static type-checking.

#### Parameters

- **path** (*str*) –
- **target** (*str*) –
- **black** (*bool*) –

`stubber.commands.get_frozen_cmd`

## Module Contents

### Functions

---

<code>cli_get_frozen</code> ([stub_folder, version, pyi, black])	Get the frozen stubs for MicroPython.
--	---------------------------------------

---

```
stubber.commands.get_frozen_cmd.cli_get_frozen(stub_folder: str = CONFIG.stub_path.as_posix(),
version: str = "", pyi: bool = True, black: bool = True)
```

Get the frozen stubs for MicroPython.

Get the frozen modules for the checked out version of MicroPython

#### Parameters

- **stub\_folder** (*str*) –
- **version** (*str*) –
- **pyi** (*bool*) –
- **black** (*bool*) –

`stubber.commands.get_lobo_cmd`

get-lobo (frozen)

## Module Contents

### Functions

<code>cli_get_lobo([stub_folder, pyi, black])</code>	Get the frozen stubs for Lobo-esp32.
--	--------------------------------------

`stubber.commands.get_lobo_cmd.cli_get_lobo(stub_folder: str = CONFIG.stub_path.as_posix(), pyi: bool = True, black: bool = True)`

Get the frozen stubs for Lobo-esp32.

#### Parameters

- **stub\_folder** (*str*) –
- **pyi** (*bool*) –
- **black** (*bool*) –

`stubber.commands.merge_cmd`

enrich machinestubs with docstubs

## Module Contents

### Functions

<code>cli_merge_docstubs(versions, boards, ports, family)</code>	Enrich the stubs in stub_folder with the docstubs in docstubs_folder.
--	---

`stubber.commands.merge_cmd.cli_merge_docstubs(versions: str | List[str], boards: str | List[str], ports: str | List[str], family: str)`

Enrich the stubs in stub\_folder with the docstubs in docstubs\_folder.

#### Parameters

- **versions** (*Union[str, List[str]]*) –
- **boards** (*Union[str, List[str]]*) –
- **ports** (*Union[str, List[str]]*) –
- **family** (*str*) –

`stubber.commands.minify_cmd`

## Module Contents

### Functions

<code>cli_minify</code> ( $\rightarrow$ int)	Minify createstubs*.py.
--	-------------------------

`stubber.commands.minify_cmd.cli_minify`(ctx, source: *str* | *pathlib.Path*, target: *str* | *pathlib.Path*, keep\_report: *bool*, diff: *bool*, cross\_compile: *bool*, all: *bool*)  $\rightarrow$  int

Minify createstubs\*.py.

Creates a minified version of the SOURCE micropython file in TARGET (file or folder). The goal is to use less memory / not to run out of memory, while generating Firmware stubs.

#### Parameters

- **source** (*Union*[*str*, *pathlib.Path*]) –
- **target** (*Union*[*str*, *pathlib.Path*]) –
- **keep\_report** (*bool*) –
- **diff** (*bool*) –
- **cross\_compile** (*bool*) –
- **all** (*bool*) –

#### Return type

int

`stubber.commands.publish_cmd`

## Module Contents

### Functions

<code>cli_publish</code> (family, versions, ports, boards[, ...])	Commandline interface to publish stubs.
---	---

`stubber.commands.publish_cmd.cli_publish`(family: *str*, versions: *str* | *List*[*str*], ports: *str* | *List*[*str*], boards: *str* | *List*[*str*], production: *bool* = *True*, build: *bool* = *False*, force: *bool* = *False*, dry\_run: *bool* = *False*, clean: *bool* = *False*)

Commandline interface to publish stubs.

#### Parameters

- **family** (*str*) –
- **versions** (*Union*[*str*, *List*[*str*]]) –
- **ports** (*Union*[*str*, *List*[*str*]]) –

- **boards** (*Union[str, List[str]]*) –
- **production** (*bool*) –
- **build** (*bool*) –
- **force** (*bool*) –
- **dry\_run** (*bool*) –
- **clean** (*bool*) –

`stubber.commands.stub_cmd`

## Module Contents

### Functions

<code>cli_stub(source)</code>	Create or update .pyi type hint files.
-------------------------------	--

`stubber.commands.stub_cmd.cli_stub(source: str | pathlib.Path)`  
 Create or update .pyi type hint files.

#### Parameters

**source** (*Union[str, *pathlib.Path*]*) –

`stubber.commands.switch_cmd`

switch to a specific version of the micropython repos

## Module Contents

### Functions

<code>cli_switch(path[, tag])</code>	Switch to a specific version of the micropython repos.
--------------------------------------	--

### Attributes

<code>VERSION_LIST</code>
---------------------------

`stubber.commands.switch_cmd.VERSION_LIST`

```
stubber.commands.switch_cmd.cli_switch(path: str | pathlib.Path, tag: str | None = None)
```

Switch to a specific version of the micropython repos.

The Micropython-lib repo will be checked out to a commit that corresponds in time to that version tag, in order to allow non-current versions to be stubbed correctly.

The repos must be cloned already

#### Parameters

- **path** (*Union*[*str*, *pathlib.Path*]) –
- **tag** (*Optional*[*str*]) –

```
stubber.commands.upd_fallback_cmd
```

update-fallback folder with common set of stubs that cater for most of the devices

## Module Contents

### Functions

<code>cli_update_fallback(version[, stub_folder])</code>	Update the fallback stubs.
--	----------------------------

```
stubber.commands.upd_fallback_cmd.cli_update_fallback(version: str, stub_folder: str =
CONFIG.stub_path.as_posix())
```

Update the fallback stubs.

The fallback stubs are updated/collated from files of the firmware-stubs, doc-stubs and core-stubs.

#### Parameters

- **version** (*str*) –
- **stub\_folder** (*str*) –

```
stubber.commands.upd_module_list_cmd
```

update-fallback folder with common set of stubs that cater for most of the devices

## Module Contents

### Functions

<code>cli_update_module_list()</code>	Update the module list based on the information in the data folder.
---------------------------------------	---

```
stubber.commands.upd_module_list_cmd.cli_update_module_list()
```

Update the module list based on the information in the data folder.

`stubber.freeze`

## Submodules

`stubber.freeze.common`

shared functions for freeze manifest processing.

## Module Contents

### Functions

<code>get_portboard</code> (manifest_path)	returns a 2-tuple of the port and board in the provided manifest path
<code>get_freeze_path</code> (→ Tuple[pathlib.Path, str])	get path to a folder to store the frozen stubs for the given port/board
<code>apply_frozen_module_fixes</code> (freeze_path, mpy_path)	apply common fixes to the frozen modules to improve stub generation

`stubber.freeze.common.get_portboard`(manifest\_path: *pathlib.Path*)

returns a 2-tuple of the port and board in the provided manifest path

raises an ValueError if neither a port or board can be found

#### Parameters

**manifest\_path** (*pathlib.Path*) –

`stubber.freeze.common.get_freeze_path`(stub\_path: *pathlib.Path*, port: *str*, board: *str*) → Tuple[pathlib.Path, str]

get path to a folder to store the frozen stubs for the given port/board

#### Parameters

- **stub\_path** (*pathlib.Path*) –
- **port** (*str*) –
- **board** (*str*) –

#### Return type

Tuple[pathlib.Path, str]

`stubber.freeze.common.apply_frozen_module_fixes`(freeze\_path: *pathlib.Path*, mpy\_path: *pathlib.Path*)

apply common fixes to the frozen modules to improve stub generation

#### Parameters

- **freeze\_path** (*pathlib.Path*) –
- **mpy\_path** (*pathlib.Path*) –

stubber.freeze.freeze\_folder

## Module Contents

### Functions

<code>freeze_folders(stub_folder, mpy_folder, lib_folder, ...)</code>	get and parse the to-be-frozen .py modules for micropython to extract the static type information
---	---

### Attributes

<code>FAMILY</code>
---------------------

stubber.freeze.freeze\_folder.FAMILY = micropython

stubber.freeze.freeze\_folder.freeze\_folders(*stub\_folder: str, mpy\_folder: str, lib\_folder: str, version: str*)

get and parse the to-be-frozen .py modules for micropython to extract the static type information locates the to-be-frozen files in modules folders - 'ports/<port>/modules/.py' - 'ports/<port>/boards/<board>/modules/.py'

#### Parameters

- **stub\_folder** (*str*) –
- **mpy\_folder** (*str*) –
- **lib\_folder** (*str*) –
- **version** (*str*) –

stubber.freeze.freeze\_manifest\_2

## Module Contents

### Functions

<code>make_path_vars(*[, mpy_path, mpy_lib_path, port, board])</code>	
<code>freeze_one_manifest_2(manifest, frozen_stub_path, ...)</code>	
<code>copy_frozen_to_stubs(stub_path, port, board, files, ...)</code>	copy the frozen files from the manifest to the stubs folder

stubber.freeze.freeze\_manifest\_2.make\_path\_vars(\*, *mpy\_path: pathlib.Path = CONFIG.mpy\_path, mpy\_lib\_path: pathlib.Path = CONFIG.mpy\_lib\_path, port: str | None = None, board: str | None = None*)

#### Parameters

- **mpy\_path** (*pathlib.Path*) –
- **mpy\_lib\_path** (*pathlib.Path*) –
- **port** (*Optional[str]*) –
- **board** (*Optional[str]*) –

`stubber.freeze.freeze_manifest_2.freeze_one_manifest_2` (*manifest: pathlib.Path, frozen\_stub\_path: pathlib.Path, mpy\_path: pathlib.Path, mpy\_lib\_path: pathlib.Path, version: str*)

#### Parameters

- **manifest** (*pathlib.Path*) –
- **frozen\_stub\_path** (*pathlib.Path*) –
- **mpy\_path** (*pathlib.Path*) –
- **mpy\_lib\_path** (*pathlib.Path*) –
- **version** (*str*) –

`stubber.freeze.freeze_manifest_2.copy_frozen_to_stubs` (*stub\_path: pathlib.Path, port: str, board: str, files: List[stubber.tools.manifestfile.ManifestOutput], version: str, mpy\_path: pathlib.Path*)

copy the frozen files from the manifest to the stubs folder

stubpath = the destination : # stubs/{family}-{version}-frozen

#### Parameters

- **stub\_path** (*pathlib.Path*) –
- **port** (*str*) –
- **board** (*str*) –
- **files** (*List[stubber.tools.manifestfile.ManifestOutput]*) –
- **version** (*str*) –
- **mpy\_path** (*pathlib.Path*) –

#### `stubber.freeze.get_frozen`

Collect modules and python stubs from MicroPython source projects (v1.12 +) and stores them in the all\_stubs folder  
The all\_stubs folder should be mapped/symlinked to the micropython\_stubs/stubs repo/folder

## Module Contents

### Functions

<code>get_manifests(→ List[pathlib.Path])</code>	Returns a list of all manifests.py files found in the ports folder of the MicroPython repo
<code>add_comment_to_path(→ None)</code>	Add a comment to the top of each file in the path
<code>freeze_any(→ int)</code>	Get and parse the to-be-frozen .py modules for micropython to extract the static type information

### Attributes

*FAMILY*

`stubber.freeze.get_frozen.FAMILY = micropython`

`stubber.freeze.get_frozen.get_manifests(mpy_path: pathlib.Path) → List[pathlib.Path]`

Returns a list of all manifests.py files found in the ports folder of the MicroPython repo

#### Parameters

`mpy_path` (*pathlib.Path*) –

#### Return type

List[*pathlib.Path*]

`stubber.freeze.get_frozen.add_comment_to_path(path: pathlib.Path, comment: str) → None`

Add a comment to the top of each file in the path using a codemod

#### Parameters

- `path` (*pathlib.Path*) –
- `comment` (*str*) –

#### Return type

None

`stubber.freeze.get_frozen.freeze_any(stub_folder: pathlib.Path, version: str, mpy_path: pathlib.Path | None = None, mpy_lib_path: pathlib.Path | None = None) → int`

Get and parse the to-be-frozen .py modules for micropython to extract the static type information

- requires that the MicroPython and Micropython-lib repos are checked out and available on a local path
- repos should be cloned side-by-side as some of the manifests refer to micropython-lib scripts using a relative path

The micropython-\* repos must be checked out to the required version/tag.

#### Parameters

- `stub_folder` (*pathlib.Path*) –
- `version` (*str*) –
- `mpy_path` (*Optional[pathlib.Path]*) –

- `mpy_lib_path` (*Optional*[*pathlib.Path*]) –

**Return type**

*int*

`stubber.publish`

## Submodules

`stubber.publish.bump`

## Module Contents

## Functions

<code>bump_version</code> ( $\rightarrow$ <i>packaging.version.Version</i> )	Increases the post release version number
--	---

`stubber.publish.bump.bump_version`(*current*: *packaging.version.Version*, \*, *major\_bump*: *bool* = *False*, *minor\_bump*: *bool* = *False*, *micro\_bump*: *bool* = *False*, *version\_bump*: *bool* = *False*, *post\_bump*: *bool* = *False*, *rc*: *int* = 0)  $\rightarrow$  *packaging.version.Version*

Increases the post release version number

This allows for a new stub-release to be published while still using the Major.Minor.Patch version numbers of Micropython if *rc* = 0(default) : bump post release

format: x.y.z.post1, x.y.z.post2 ...

**if *rc* specified:**

drop the post release and set the release candidate number

ref: <https://peps.python.org/pep-0440/>

### Parameters

- ***current*** (*packaging.version.Version*) –
- ***major\_bump*** (*bool*) –
- ***minor\_bump*** (*bool*) –
- ***micro\_bump*** (*bool*) –
- ***version\_bump*** (*bool*) –
- ***post\_bump*** (*bool*) –
- ***rc*** (*int*) –

**Return type**

*packaging.version.Version*

## stubber.publish.candidates

In order to generate stups for all ports and boars and versions of micropython we need to know what versions are available. This module provides functions to :

- get a list of all ports for a given version of micropython ( list micropython ports)
- get a list of all ports and board for a given version of micropython (list micropython ports boards)
  - get a list of versions for micropython ( version candidates)
- get the frozen stubs for a given version of micropython ( frozen candidates)
- get a list of all the docstubs (docstub candidates)
- get a list of the firmware/board stubs (firmware candidates)

## Module Contents

### Functions

<i>subfolder_names</i> (path)	returns a list of names of the subfolders of the given path
<i>version_candidates</i> (→ Generator[str, None, None])	get a list of versions for the given family and suffix
<i>list_frozen_ports</i> ([family, version, path])	get list of ports with frozen stubs for a given family and version
<i>list_micropython_ports</i> ([family, mpy_path])	get list of micropython ports for a given family and version
<i>list_micropython_port_boards</i> (port[, family, mpy_path])	get list of micropython boards for a given family version and board
<i>frozen_candidates</i> (→ Generator[Dict[str, Any], None, None])	generate a list of possible firmware stubs for the given family (, version port and board) ?
<i>is_auto</i> (thing)	Is this version/port/board specified as 'auto' ?
<i>docstub_candidates</i> ([family, versions, path])	Generate a list of possible documentation stub candidates for the given family and version.
<i>board_candidates</i> ([family, versions, mpy_path, pt])	generate a list of possible board stub candidates for the given family and version.
<i>filter_list</i> (worklist[, ports, boards])	filter a list of candidates down to the ones we want, based on the ports and boars specified (case insensitive)

### Attributes

<i>OLDEST_VERSION</i>	This is the oldest MicroPython version to build the stubs on
<i>V_LATEST</i>	

stubber.publish.candidates.OLDEST\_VERSION = 1.16

This is the oldest MicroPython version to build the stubs on

stubber.publish.candidates.V\_LATEST = latest

`stubber.publish.candidates.subfolder_names(path: pathlib.Path)`

returns a list of names of the subfolders of the given path

**Parameters**

**path** (*pathlib.Path*) –

`stubber.publish.candidates.version_candidates(suffix: str, prefix='.*', *, path=CONFIG.stub_path, oldest=OLDEST_VERSION) → Generator[str, None, None]`

get a list of versions for the given family and suffix

**Parameters**

**suffix** (*str*) –

**Return type**

Generator[*str*, *None*, *None*]

`stubber.publish.candidates.list_frozen_ports(family: str = 'micropython', version: str = V_LATEST, path=CONFIG.stub_path)`

get list of ports with frozen stubs for a given family and version

**Parameters**

- **family** (*str*) –
- **version** (*str*) –

`stubber.publish.candidates.list_micropython_ports(family: str = 'micropython', mpy_path=CONFIG.mpy_path)`

get list of micropython ports for a given family and version

**Parameters**

**family** (*str*) –

`stubber.publish.candidates.list_micropython_port_boards(port: str, family: str = 'micropython', mpy_path=CONFIG.mpy_path)`

get list of micropython boards for a given family version and board

**Parameters**

- **port** (*str*) –
- **family** (*str*) –

`stubber.publish.candidates.frozen_candidates(family: str = 'micropython', versions: str | List[str] = V_LATEST, ports: str | List[str] = 'auto', boards: str | List[str] = 'auto', *, path=CONFIG.stub_path) → Generator[Dict[str, Any], None, None]`

generate a list of possible firmware stubs for the given family (, version port and board) ? - family = micropython

board and port are ignored, they are looked up from the available frozen stubs

- versions = 'latest' , 'auto' or a list of versions
- port = 'auto' or a specific port
- board = 'auto' or a specific board, 'generic' must be specified in lowercase

**Parameters**

- **family** (*str*) –

- **versions** (*Union[str, List[str]]*) –
- **ports** (*Union[str, List[str]]*) –
- **boards** (*Union[str, List[str]]*) –

**Return type**

Generator[Dict[str, Any], None, None]

`stubber.publish.candidates.is_auto(thing)`

Is this version/port/board specified as 'auto' ?

`stubber.publish.candidates.docstub_candidates(family: str = 'micropython', versions: str | List[str] = V_LATEST, path=CONFIG.stub_path)`

Generate a list of possible documentation stub candidates for the given family and version.

Note that the folders do not need to exist, with the exception of auto which will scan the stubs folder for versions of docstubs

**Parameters**

- **family** (*str*) –
- **versions** (*Union[str, List[str]]*) –

`stubber.publish.candidates.board_candidates(family: str = 'micropython', versions: str | List[str] = V_LATEST, *, mpy_path=CONFIG.mpy_path, pt=FIRMWARE_STUBS)`

generate a list of possible board stub candidates for the given family and version. list is based on the micropython repo: /ports/<list of ports>/boards/<list of boards>

**Parameters**

- **family** (*str*) –
- **versions** (*Union[str, List[str]]*) –

`stubber.publish.candidates.filter_list(worklist: List[Dict[str, str]], ports: List[str] | str | None = None, boards: List[str] | str | None = None)`

filter a list of candidates down to the ones we want, based on the ports and boards specified (case insensitive) for board also match using a '**GENERIC\_**' prefix, so board 's3' will match candidate 'GENERIC\_S3'

**Parameters**

- **worklist** (*List[Dict[str, str]]*) –
- **ports** (*Optional[Union[List[str], str]]*) –
- **boards** (*Optional[Union[List[str], str]]*) –

**stubber.publish.database**

basic interface to the json database

## Module Contents

### Functions

<code>get_database</code> (→ pysondb.PysonDB)	Open the json database at the given path.
---	---

`stubber.publish.database.get_database(publish_path: pathlib.Path | str, production: bool = False)` → `pysondb.PysonDB`

Open the json database at the given path.

The database should be located in a subfolder */publish* of the root path. The database name is determined by the production flag as *package\_data[\_test].jsondb*

#### Parameters

- **publish\_path** (*Union*[*pathlib.Path*, *str*]) –
- **production** (*bool*) –

#### Return type

`pysondb.PysonDB`

### `stubber.publish.enums`

Enumerations for the stubber package.

## Module Contents

### Classes

<code>StubSource</code>	<code>str(object='') -&gt; str</code>
-------------------------	---------------------------------------

### Attributes

<code>ALL_TYPES</code>
<code>COMBO_STUBS</code>
<code>DOC_STUBS</code>
<code>CORE_STUBS</code>
<code>FIRMWARE_STUBS</code>

**class** stubber.publish.enums.StubSource

Bases: `str`, `enum.Enum`

`str(object=)` -> `str` `str(bytes_or_buffer[, encoding[, errors]])` -> `str`

Create a new string object from the given object. If encoding or errors is specified, then the object must expose a data buffer that will be decoded using the given encoding and error handler. Otherwise, returns the result of `object.__str__()` (if defined) or `repr(object)`. encoding defaults to `sys.getdefaultencoding()`. errors defaults to 'strict'.

**FIRMWARE = Firmware stubs**

stubs built by combining the firmware, frozen and core stubs

**FROZEN = Frozen stubs**

stubs of python modules that are frozen as part of the firmware image

**CORE = Core stubs**

stubs that allow (some) MicroPython code to be run by CPython

**DOC = Doc stubs**

stubs built by parsing the micropython RST documentation files

**MERGED = Merged stubs**

stubs built by merging the information from doc-stubs and firmware-stubs

`stubber.publish.enums.ALL_TYPES = ['combo', 'doc', 'core', 'firmware']`

`stubber.publish.enums.COMBO_STUBS`

`stubber.publish.enums.DOC_STUBS`

`stubber.publish.enums.CORE_STUBS`

`stubber.publish.enums.FIRMWARE_STUBS`

`stubber.publish.merge_docstubs`

Merge firmware stubs and docstubs into a single folder

## Module Contents

## Functions

<code>get_base(candidate[, version])</code>	
<code>board_folder_name(fw, *[, version])</code>	return the name of the firmware folder
<code>get_board_path(fw)</code>	
<code>get_merged_path(fw)</code>	
<code>merge_all_docstubs([versions, family, ports, boards, ...])</code>	merge docstubs and board stubs to merged stubs
<code>copy_and_merge_docstubs(fw_path, dest_path, docstub_path)</code>	<p><b>param fw_path</b> Path to firmware stubs (absolute path)</p>

`stubber.publish.merge_docstubs.get_base(candidate, version: str | None = None)`

### Parameters

**version** (*Optional*[*str*]) –

`stubber.publish.merge_docstubs.board_folder_name(fw: Dict, *, version: str | None = None)`

return the name of the firmware folder

### Parameters

- **fw** (*Dict*) –
- **version** (*Optional*[*str*]) –

`stubber.publish.merge_docstubs.get_board_path(fw: Dict)`

### Parameters

**fw** (*Dict*) –

`stubber.publish.merge_docstubs.get_merged_path(fw: Dict)`

### Parameters

**fw** (*Dict*) –

`stubber.publish.merge_docstubs.merge_all_docstubs(versions: List[str] | str = ['v1.19.1'], family: str = 'micropython', ports: List[str] | str = ['auto'], boards: List[str] | str = [GENERIC_L], *, mpy_path=CONFIG.mpy_path)`

merge docstubs and board stubs to merged stubs

### Parameters

- **versions** (*Union*[*List*[*str*], *str*]) –
- **family** (*str*) –
- **ports** (*Union*[*List*[*str*], *str*]) –
- **boards** (*Union*[*List*[*str*], *str*]) –

`stubber.publish.merge_docstubs.copy_and_merge_docstubs(fw_path: pathlib.Path, dest_path: pathlib.Path, docstub_path: pathlib.Path)`

### Parameters

- **fw\_path** (*pathlib.Path*) – Path to firmware stubs (absolute path)
- **dest\_path** (*pathlib.Path*) – Path to destination (absolute path)
- **mpy\_version** – micropython version ('1.18')
- **docstub\_path** (*pathlib.Path*) –

Copy files from the firmware stub folders to the merged - 1 - Copy all firmware stubs to the package folder - 1.B  
- clean up a little bit - 2 - Enrich the firmware stubs with the document stubs

### stubber.publish.package

prepare a set of stub files for publishing to PyPi

### Module Contents

#### Functions

<i>package_name</i> (→ str)		generate a package name for the given package type
<i>get_package</i> (→ ber.publish.stubpacker.StubPackage)	stub-	Get the package from the database or create a new one if it does not exist.
<i>get_package_info</i> (→ Union[Dict, None])		get a package's record from the json db if it can be found
<i>create_package</i> (→ ber.publish.stubpacker.StubPackage)	stub-	create and initialize a package with the correct sources
<i>combo_sources</i> (→ List[Tuple[str, pathlib.Path]])		Build a source set for combo stubs

#### Attributes

<i>GENERIC_L</i>	generic lowercase
<i>GENERIC_U</i>	GENERIC uppercase
<i>GENERIC</i>	GENERIC eithercase

stubber.publish.package.GENERIC\_L = **generic**  
generic lowercase

stubber.publish.package.GENERIC\_U = **GENERIC**  
GENERIC uppercase

stubber.publish.package.GENERIC  
GENERIC eithercase

stubber.publish.package.**package\_name**(*pkg\_type: str*, \*, *port: str = "*, *board: str = "*, *family='micropython'*,  
\*\**kwargs*) → *str*  
generate a package name for the given package type

### Parameters

- **pkg\_type** (*str*) –

- **port** (*str*) –
- **board** (*str*) –

**Return type**

*str*

`stubber.publish.package.get_package(db: pysondb.PysonDB, *, pkg_type, version: str, port: str, board: str = GENERIC_L, family: str = 'micropython') → stubber.publish.stubpacker.StubPackage`

Get the package from the database or create a new one if it does not exist.

**Parameters**

- **db** (*pysondb.PysonDB*) –
- **version** (*str*) –
- **port** (*str*) –
- **board** (*str*) –
- **family** (*str*) –

**Return type**

*stubber.publish.stubpacker.StubPackage*

`stubber.publish.package.get_package_info(db: pysondb.PysonDB, pub_path: pathlib.Path, *, pkg_name: str, mpy_version: str) → Dict | None`

get a package's record from the json db if it can be found matches om the package name and version

pkg\_name: package name (micropython-esp32-stubs) mpy\_version: micropython/firmware version (1.18)

**Parameters**

- **db** (*pysondb.PysonDB*) –
- **pub\_path** (*pathlib.Path*) –
- **pkg\_name** (*str*) –
- **mpy\_version** (*str*) –

**Return type**

Union[Dict, None]

`stubber.publish.package.create_package(pkg_name: str, mpy_version: str, *, port: str = "", board: str = "", family: str = 'micropython', pkg_type=COMBO_STUBS) → stubber.publish.stubpacker.StubPackage`

create and initialize a package with the correct sources

**Parameters**

- **pkg\_name** (*str*) –
- **mpy\_version** (*str*) –
- **port** (*str*) –
- **board** (*str*) –
- **family** (*str*) –

### Return type

*stubber.publish.stubpacker.StubPackage*

`stubber.publish.package.combo_sources(family: str, port: str, board: str, ver_flat: str) → List[Tuple[str, pathlib.Path]]`

### Build a source set for combo stubs

•

### Parameters

- **family** (*str*) –
- **port** (*str*) –
- **board** (*str*) –
- **ver\_flat** (*str*) –

### Return type

List[Tuple[str, pathlib.Path]]

## stubber.publish.publish

prepare a set of stub files for publishing to PyPi

!!Note: anything excluded in .gitignore is not packaged by poetry

## Module Contents

### Functions

<i>build_multiple</i> (→ List[Dict[str, Any]])	Build a bunch of stub packages
<i>publish_multiple</i> (→ List[Dict[str, Any]])	Publish a bunch of stub packages
<i>build_worklist</i> (family, versions, ports, boards)	Build a worklist of packages to build or publish, and filter to only the requested ports and boards

`stubber.publish.publish.build_multiple(family: str = 'micropython', versions: List[str] = ['v1.19.1'], ports: List[str] = ['auto'], boards: List[str] = [GENERIC_L], production: bool = False, clean: bool = False, force: bool = False) → List[Dict[str, Any]]`

Build a bunch of stub packages

### Parameters

- **family** (*str*) –
- **versions** (List[*str*]) –
- **ports** (List[*str*]) –
- **boards** (List[*str*]) –
- **production** (*bool*) –
- **clean** (*bool*) –

- **force** (*bool*) –

**Return type**

List[Dict[str, Any]]

```
stubber.publish.publish.publish_multiple(family: str = 'micropython', versions: List[str] = ['v1.19.1'],
                                           ports: List[str] = ['auto'], boards: List[str] = [GENERIC_L],
                                           production: bool = False, clean: bool = False, build: bool =
                                           False, force: bool = False, dry_run: bool = False) →
                                           List[Dict[str, Any]]
```

Publish a bunch of stub packages

**Parameters**

- **family** (*str*) –
- **versions** (*List[str]*) –
- **ports** (*List[str]*) –
- **boards** (*List[str]*) –
- **production** (*bool*) –
- **clean** (*bool*) –
- **build** (*bool*) –
- **force** (*bool*) –
- **dry\_run** (*bool*) –

**Return type**

List[Dict[str, Any]]

```
stubber.publish.publish.build_worklist(family: str, versions: List[str], ports: List[str] | str, boards:
                                         List[str] | str)
```

Build a worklist of packages to build or publish, and filter to only the requested ports and boards

**Parameters**

- **family** (*str*) –
- **versions** (*List[str]*) –
- **ports** (*Union[List[str], str]*) –
- **boards** (*Union[List[str], str]*) –

## stubber.publish.pypi

Read versions published to PyPi or test.PyPi. uses the pypi-simple package to get the versions from the simple index.

## Module Contents

### Functions

<code>get_pypi_versions(package_name[, base, production])</code>	Get all versions of a package from a PyPI endpoint.
--	---

`stubber.publish.pypi.get_pypi_versions(package_name: str, base: packaging.version.Version | None = None, production: bool = True)`

Get all versions of a package from a PyPI endpoint.

#### Parameters

- **package\_name** (*str*) –
- **base** (*Optional[packaging.version.Version]*) –
- **production** (*bool*) –

### `stubber.publish.stubpacker`

Create a stub-only package for a specific version of micropython

## Module Contents

### Classes

<code>StubPackage</code>	Create a stub-only package for a specific version , port and board of micropython
--------------------------	---

### Attributes

<code>Status</code>
---------------------

`stubber.publish.stubpacker.Status`

```
class stubber.publish.stubpacker.StubPackage(package_name: str, version: str = '0.0.1', description: str = 'MicroPython stubs', stubs: List[Tuple[str, pathlib.Path]] | None = None, json_data: Dict[str, Any] | None = None)
```

Create a stub-only package for a specific version , port and board of micropython

#### properties:

- `toml_path` - the path to the `pyproject.toml` file
- `package_path` - the path to the folder where the package info will be stored (`'./publish'`).

- `pkg_version` - the version of the package as used on PyPi (semver). Is stored directly in the *pyproject.toml* file
- `pyproject` - the contents of the *pyproject.toml* file

#### Parameters

- `package_name` (*str*) –
  - `version` (*str*) –
  - `description` (*str*) –
  - `stubs` (*Optional[List[Tuple[str, pathlib.Path]]*) –
  - `json_data` (*Optional[Dict[str, Any]]*) –
- `from_json` - load the package from json
  - `to_json` - return the package as json
  - `create_update_pyproject_toml` - create or update the ``pyproject.toml`` file
  - `create_readme` - create the readme file
  - `create_license` - create the license file
  - `copy_stubs` - copy the stubs to the package folder
  - `update_included_stubs` - update the included stubs in the ``pyproject.toml`` file
  - `create_hash` - create a hash of the package files
  - `update_package_files` - combines clean, copy, and create reeadme & updates

`update_pkg_version(production: bool) → str`

Get the next version for the package

#### Parameters

- `production` (*bool*) –

#### Return type

*str*

`get_prerelease_package_version(production: bool = False) → str`

Get the next prerelease version for the package.

#### Parameters

- `production` (*bool*) –

#### Return type

*str*

`get_next_package_version(prod: bool = False) → str`

Get the next version for the package.

#### Parameters

- `prod` (*bool*) –

#### Return type

*str*

**to\_dict()** → dict

return the package as a dict to store in the jsondb

need to simplify some of the Objects to allow serialisation to json - the paths to posix paths - the version (semver) to a string - toml file to list of lines

**Return type**

dict

**from\_dict(json\_data: Dict)** → None

load the package from a dict (from the jsondb)

**Parameters**

**json\_data** (Dict) –

**Return type**

None

**update\_package\_files()** → None

**Update the stub-only package for a specific version of micropython**

- cleans the package folder
- copies the stubs from the list of stubs.
- creates/updates the readme and the license file

**Return type**

None

**copy\_stubs()** → None

Copy files from all listed stub folders to the package folder the order of the stub folders is relevant as “last copy wins”

- 1 - Copy all firmware stubs/merged to the package folder
- 2 - copy the remaining stubs to the package folder
- 3 - remove \*.py files from the package folder

**Return type**

None

**create\_readme()** → None

**Create a readme file for the package**

- based on the template readme file
- with a list of all included stub folders added to it (not the individual stub-files)

**Return type**

None

**create\_license()** → None

**Create a license file for the package**

- copied from the template license file

**Return type**

None

**create\_update\_pyproject\_toml()** → None

create or update/overwrite a *pyproject.toml* file by combining a template file with the given parameters. and updating it with the pyi files included

**Return type**

None

**update\_included\_stubs()** → int

Add the stub files to the pyproject.toml file

**Return type**

int

**clean()** → None

Remove the stub files from the package folder

This is used before update the stub package, to avoid lingering stub files, and after the package has been built, to avoid needing to store files multiple times.

*.gitignore* cannot be used as this will prevent poetry from processing the files.

**Return type**

None

**calculate\_hash(include\_md: bool = True)** → str

Create a SHA1 hash of all files in the package, excluding the pyproject.toml file itself. the hash is based on the content of the .py/.pyi and .md files in the package. if include\_md is False , the .md files are not hashed, allowing the files in the packages to be compared simply As a single has is created across all files, the files are sorted prior to hashing to ensure that the hash is stable.

A changed hash will not indicate which of the files in the package have been changed.

**Parameters**

**include\_md** (bool) –

**Return type**

str

**update\_hashes(ret=False)** → None

Update the package hashes. Resets is\_changed() to False

**Return type**

None

**is\_changed(include\_md: bool = True)** → bool

Check if the package has changed, based on the current and the stored hash. The default checks the hash of all files, including the .md files.

**Parameters**

**include\_md** (bool) –

**Return type**

bool

**bump(\*, rc: int = 0)** → str

bump the postrelease version of the package, and write the change to disk if rc > 1, the version is bumped to the specified release candidate

### Parameters

**rc** (*int*) –

### Return type

*str*

**run\_poetry**(*parameters: List[str]*) → *bool*

Run a poetry commandline in the package folder. Note: this may write some output to the console ('All set!')

### Parameters

**parameters** (*List[str]*) –

### Return type

*bool*

**write\_package\_json**() → *None*

write the package.json file to disk

### Return type

*None*

**check**() → *bool*

check if the package is valid by running *poetry check* Note: this will write some output to the console ('All set!')

### Return type

*bool*

**poetry\_build**() → *bool*

build the package by running *poetry build*

### Return type

*bool*

**poetry\_publish**(*production: bool = False*) → *bool*

### Parameters

**production** (*bool*) –

### Return type

*bool*

**are\_package\_sources\_available**() → *bool*

Check if (all) the packages sources exist.

### Return type

*bool*

**update\_package**() → *bool*

Update the package .pyi files, if all the sources are available

### Return type

*bool*

**build**(*production: bool, force=False*) → *bool*

Build a package look up the previous package version in the dabase

- update package files
- build the wheels and sdist

#### Parameters

**production** (*bool*) –

#### Return type

*bool*

**publish**(*db: pysondb.PysonDB, \*, production: bool, build=False, force=False, dry\_run=False, clean: bool = False*) → *bool*

Publish a package to PyPi look up the previous package version in the dabase, and only publish if there are changes to the package - change determiend by hash across all files

#### Build

- update package files
- build the wheels and sdist

#### Publish

- publish to PyPi
- update database with new hash

#### Parameters

- **db** (*pysondb.PysonDB*) –
- **production** (*bool*) –
- **clean** (*bool*) –

#### Return type

*bool*

### Submodules

#### stubber.rst.classsort

Sort list of classess in parent-child order note that this does not take multiple inheritance into account ref : <https://stackoverflow.com/questions/34964878/python-generate-a-dictionarytree-from-a-list-of-tuples/35049729#35049729> with modification

### Module Contents

#### Functions

<i>sort_classes</i> (classes)	sort a list of classes to respect the parent-child order
-------------------------------	--

`stubber.rst.classsort.sort_classes(classes: List[str])`

sort a list of classes to respect the parent-child order

**Parameters**

**classes** (`List[str]`) –

## `stubber.rst.lookup`

this is an list with manual overrides for function returns that could not efficiently be determined from their docstring description Format: a dictionary with : - key = module.[class.]function name - value : two-tuple with ( return type , priority )

## Module Contents

`stubber.rst.lookup.U_MODULES = ['os', 'time', 'array', 'binascii', 'io', 'json', 'select', 'socket', 'ssl', 'struct', 'zlib']`

List of modules that are documented with the base name only, but can also be imported with a *u* prefix

`stubber.rst.lookup.RST_DOC_FIXES :List[Tuple[str, str]] = [['.. method:: match.', '.. method:: Match.'], [' match.end', ' ...`

`stubber.rst.lookup.DOCSTUB_SKIP = ['uasyncio.rst', 'builtins.rst', 're.rst']`

`stubber.rst.lookup.LOOKUP_LIST`

`stubber.rst.lookup.NONE_VERBS = ['Activate ', 'Build a ', 'Cancel ', 'Clear ', 'Close ', 'cancel ', 'Configure ', 'Connect ',...`

`stubber.rst.lookup.MODULE_GLUE`

`stubber.rst.lookup.PARAM_FIXES`

`stubber.rst.lookup.CHILD_PARENT_CLASS`

## `stubber.rst.output_dict`

**ModuleSourceDict** represents a source file with the following components

- docstr
- version
- comment
- typing
- Optional: list of constants
- optional: ClassSourcedicts
- optional: FunctionSourcedicts
- optional: individual lines of code

**ClassSourceDict** represents a source file with the following components

- comment

- class
- docstr
- Optional: list of constants
- `__init__` : class signature
- optional: FunctionSourcedicts
- optional: individual lines of code

**FunctionSourceDict** represents a source file with the following components

- # comments - todo
- optional: decorator
- def - function definition
- docstr
- constants
- body - ...
- optional: individual lines of code

SourceDict is the 'base class'

## Module Contents

### Classes

<i>SourceDict</i>	(abstract) dict to store source components respecting parent child dependencies and proper definition order
<i>ModuleSourceDict</i>	(abstract) dict to store source components respecting parent child dependencies and proper definition order
<i>ClassSourceDict</i>	(abstract) dict to store source components respecting parent child dependencies and proper definition order
<i>FunctionSourceDict</i>	(abstract) dict to store source components respecting parent child dependencies and proper definition order

**class** stubber.rst.output\_dict.**SourceDict**(base: List, indent: *int* = 0, body: *int* = 0, lf: *str* = '\n')

Bases: OrderedDict

(abstract) dict to store source components respecting parent child dependencies and proper definition order

#### Parameters

- **base** (*List*) –
- **indent** (*int*) –
- **body** (*int*) –
- **lf** (*str*) –

**\_\_str\_\_**() → *str*

convert the OD into a string

**Return type**

*str*

**\_\_add\_\_**(*dict*: *SourceDict*)

**Parameters**

**dict** (*SourceDict*) –

**add\_docstr**(*docstr*: *str* | *List[str]*, *extra*: *int* = 0)

**Parameters**

- **docstr** (*Union[str, List[str]]*) –
- **extra** (*int*) –

**add\_comment**(*line*: *str* | *List[str]*)

Add a comment, or list of comments, to this block.

**Parameters**

**line** (*Union[str, List[str]]*) –

**add\_constant**(*line*: *str*, *autoindent*: *bool* = *True*)

add constant to the constant scope of this block

**Parameters**

- **line** (*str*) –
- **autoindent** (*bool*) –

**add\_constant\_smart**(*name*: *str*, *type*: *str* = 'Any', *docstr*: *List[str]* | *None* = *None*, *autoindent*: *bool* = *True*)

add literal / constant to the constant scope of this block, or a class in this block

**Parameters**

- **name** (*str*) –
- **type** (*str*) –
- **docstr** (*Optional[List[str]]*) –
- **autoindent** (*bool*) –

**abstract find**(*name*: *str*) → *str* | *None*

**Parameters**

**name** (*str*) –

**Return type**

*Union[str, None]*

**add\_line**(*line*: *str*, *autoindent*: *bool* = *True*)

**Parameters**

- **line** (*str*) –
- **autoindent** (*bool*) –

**index**(key: *str*)

**Parameters**

**key** (*str*) –

**class** stubber.rst.output\_dict.**ModuleSourceDict**(name: *str*, indent=0, lf: *str* = '\n')

Bases: *SourceDict*

(abstract) dict to store source components respecting parent child dependencies and proper definition order

**Parameters**

- **name** (*str*) –

- **lf** (*str*) –

**sort**()

make sure all classdefs are in order

**\_\_str\_\_**()

convert the OD into a string

**find**(name: *str*) → *str* | *None*

find a classnode based on the name with or without the superclass

**Parameters**

**name** (*str*) –

**Return type**

Union[*str*, *None*]

**classes**()

get a list of the class names in parent-child order

**add\_import**(imports: *str* | List[*str*])

add a [list of] imports this module

**Parameters**

**imports** (Union[*str*, List[*str*]]) –

**class** stubber.rst.output\_dict.**ClassSourceDict**(name: *str*, \*, docstr: List[*str*] | *None* = *None*, init: *str* = "", indent: *int* = 0, lf='\n')

Bases: *SourceDict*

(abstract) dict to store source components respecting parent child dependencies and proper definition order

**Parameters**

- **name** (*str*) –

- **docstr** (Optional[List[*str*]]) –

- **init** (*str*) –

- **indent** (*int*) –

**class** stubber.rst.output\_dict.**FunctionSourceDict**(name: *str*, \*, definition: List[*str*] | *None* = *None*, docstr: List[*str*] | *None* = *None*, indent: *int* = 0, decorators: List[*str*] | *None* = *None*, lf='\n')

Bases: *SourceDict*

(abstract) dict to store source components respecting parent child dependencies and proper definition order

**Parameters**

- **name** (*str*) –
- **definition** (*Optional[List[str]*) –
- **docstr** (*Optional[List[str]*) –
- **indent** (*int*) –
- **decorators** (*Optional[List[str]*) –

## stubber.rst.reader

Read the Micropython library documentation files and use them to build stubs that can be used for static typechecking using a custom-built parser to read and process the micropython RST files - generates:

- **modules**
  - docstrings
- **function definitions**
  - function parameters based on documentation
  - docstrings
- **classes**
  - docstrings
  - `__init__` method
  - parameters based on documentation for class
  - **methods**
    - \* parameters based on documentation for the method
    - \* docstrings
- exceptions
- **Tries to determine the return type by parsing the docstring.**
  - Imperative verbs used in docstrings have a strong correlation to return -> None
  - recognizes documented Generators, Iterators, Callable
  - Coroutines are identified based tag “This is a Coroutine”. Then if the return type was Foo, it will be transformed to : Coroutine[Foo]
  - a static Lookup list is used for a few methods/functions for which the return type cannot be determined from the docstring.
  - add NoReturn to a few functions that never return ( stop / deepsleep / reset )
  - if no type can be detected the type *Any* is used

The generated stub files are formatted using *black* and checked for validity using *pyright* Note: black on python 3.7 does not like some function defs `def sizeof(struct, layout_type=NATIVE, /) -> int:`

- ordering of inter-dependent classes in the same module
- **Literals / constants**
  - documentation contains repeated vars with the same indentation
  - Module level:

```
.. data:: IPPROTO_UDP
        IPPROTO_TCP
```

– class level:

```
.. data:: Pin.IRQ_FALLING
        Pin.IRQ_RISING
        Pin.IRQ_LOW_LEVEL
        Pin.IRQ_HIGH_LEVEL

        Selects the IRQ trigger type.
```

– literals documented using a wildcard are added as comments only

- Add GLUE imports to allow specific modules to import specific others.
- **Repeats of definitions in the rst file for similar functions or literals**
  - CONSTANTS ( module and Class level )
  - functions
  - methods
- **Child/ Parent classes**  
are added based on a (manual) lookup table CHILD\_PARENT\_CLASS

## Module Contents

### Classes

<i>FileReadWriter</i>	base class for reading rst files
<i>RSTReader</i>	base class for reading rst files
<i>RSTParser</i>	Parse the RST file and create a ModuleSourceDict
<i>RSTWriter</i>	Reads, parses and writes

### Attributes

*SEPERATOR*

```
stubber.rst.reader.SEPERATOR = ::
```

```
class stubber.rst.reader.FileReadWriter
```

base class for reading rst files

```
read_file(filename: pathlib.Path)
```

**Parameters**

**filename** (*pathlib.Path*) –

**write\_file**(filename: *pathlib.Path*) → bool

**Parameters**

**filename** (*pathlib.Path*) –

**Return type**

bool

**static is\_balanced**(s: *str*) → bool

Check if a string has balanced parentheses

**Parameters**

**s** (*str*) –

**Return type**

bool

**extend\_and\_balance\_line**() → *str*

Append the current line + next line in order to try to balance the parentheses in order to do this the rst\_test array is changed by the function and max\_line is adjusted

**Return type**

*str*

**class stubber.rst.reader.RSTReader**

Bases: *FileReadWriter*

base class for reading rst files

**read\_file**(filename: *pathlib.Path*)

**Parameters**

**filename** (*pathlib.Path*) –

**read\_docstring**() → List[*str*]

Read a textblock that will be used as a docstring, or used to process a toc tree The textblock is terminated at the following RST line structures/tags

– Heading == Heading ~~ Heading

The blank lines at the start and end are removed to limit the space the docstring takes up.

**Return type**

List[*str*]

**static clean\_docstr**(block)

Clean up a docstring

**static add\_link\_to\_docsstr**(block)

Add clickable hyperlinks to CPython docpages

**get\_rst\_hint**()

parse the ‘.. <rst hint>:: ‘ from the current line

**strip\_prefixes**(name: *str*, strip\_mod: *bool* = True, strip\_class: *bool* = False)

Remove the modulename. and or the classname. from the begining of a name

**Parameters**

- **name** (*str*) –
- **strip\_mod** (*bool*) –

- **strip\_class** (*bool*) –

**class** stubber.rst.reader.RSTParser(*v\_tag: str*)

Bases: *RSTReader*

Parse the RST file and create a ModuleSourceDict most methods have side effects

**Parameters**

- v\_tag** (*str*) –

**target** = .py

**PARAM\_RE\_FIXES**

**leave\_class**()

**fix\_parameters**(*params: str, name: str = ""*) → *str*

Patch / correct the documentation parameter notation to a supported format that works for linting. - name is the name of the function or method or Class

**Parameters**

- **params** (*str*) –
- **name** (*str*) –

**Return type**

*str*

**static apply\_fix**(*fix: stubber.rst.lookup.Fix, params: str, name: str = ""*)

**Parameters**

- **fix** (*stubber.rst.lookup.Fix*) –
- **params** (*str*) –
- **name** (*str*) –

**create\_update\_class**(*name: str, params: str, docstr: List[str]*)

**Parameters**

- **name** (*str*) –
- **params** (*str*) –
- **docstr** (*List[str]*) –

**parse\_toc**()

process table of content with additional rst files, and add / include them in the current module

**parse\_module**()

parse a module tag and set the module's docstring

**parse\_current\_module**()

**parse\_function**()

**parse\_class**()

**parse\_method**()

**parse\_exception**()

**parse\_name**(line: *str* | *None* = *None*)

get the constant/function/class name from a line with an identifier

**Parameters**

**line** (*Optional*[*str*]) –

**parse\_names**(oneliner: *bool* = *True*)

get a list of constant/function/class names from and following a line with an identifier advances the linecounter

oneliner : treat a line with commas as multiple names (used for constants)

**Parameters**

**oneliner** (*bool*) –

**parse\_data**()

proces ..data:: lines ( one or more)

**parse**()

**class** stubber.rst.reader.**RSTWriter**(v\_tag='v1.xx')

Bases: *RSTParser*

Reads, parses and writes

**write\_file**(filename: *pathlib.Path*) → *bool*

**Parameters**

**filename** (*pathlib.Path*) –

**Return type**

*bool*

**prepare\_output**()

clean up some trailing spaces and commas

**stubber.rst.report\_return**

Work in Progress

build test and % report Will need to be updated after new\_output has been implemented.

## Module Contents

### Functions

*process*(folder, pattern)

stubber.rst.report\_return.**process**(folder: *pathlib.Path*, pattern: *str*)

**Parameters**

- **folder** (*pathlib.Path*) –
- **pattern** (*str*) –

## stubber.rst.rst\_utils

**Tries to determine the return type by parsing the docstring and the function signature**

- if the signature contains a return type → <something> then that is returned
- **check a lookup dictionary of type overrides**,  
if the functionnae is listed, then use the override
- **use re to find phrases such as:**
  - ‘Returns ..... ‘
  - ‘Gets ..... ‘
- docstring is joined without newlines to simplify parsing
- then parses the docstring to find references to known types and give then a rating though a hand coded model ()
- builds a list return type candidates
- selects the highest ranking candidate
- the default Type is ‘Any’

to do:

- **regex :**
  - ‘With no arguments the frequency in Hz is returned.’
  - ‘Get or set’ → indicates overloaded/optional return Union[None,...]
  - add regex for ‘Query’ ` Otherwise, query current state if no argument is provided. `
- **regex :**
  - ‘With no arguments the frequency in Hz is returned.’
  - ‘Get or set’ → indicates overloaded/optional return Union[None,...]
  - add regex for ‘Query’ ` Otherwise, query current state if no argument is provided. `
- **try if an Azure Machine Learning works as well**  
<https://docs.microsoft.com/en-us/azure/machine-learning/quickstart-create-resources>
- 

## Module Contents

## Functions

<code>simple_candidates</code> (type, match_string, keywords[, ...])	find and rate possible types and confidence weighting for simple types.
<code>compound_candidates</code> (type, match_string, keywords[, ...])	find and rate possible types and confidence weighting for compound types that can have a subscription.
<code>object_candidates</code> (match_string[, rate, exclude])	find and rate possible types and confidence weighting for Object types.
<code>distill_return</code> (→ List[Dict])	Find return type and confidence.
<code>return_type_from_context</code> (*, docstring, signature, module)	
<code>_type_from_context</code> (*, docstring, signature, module[, ...])	Determine the return type of a function or method based on:

## Attributes

`TYPING_IMPORT`

`stubber.rst.rst_utils.TYPING_IMPORT :List[str] = ['from typing import IO, Any, Callable, Coroutine, Dict, Generator, Iterator, List, NoReturn,...`

`stubber.rst.rst_utils.simple_candidates`(type: *str*, match\_string: *str*, keywords: *List[str]*, rate: *float* = 0.5, exclude: *List[str] | None* = None)

find and rate possible types and confidence weighting for simple types. Case sensitive

### Parameters

- **type** (*str*) –
- **match\_string** (*str*) –
- **keywords** (*List[str]*) –
- **rate** (*float*) –
- **exclude** (*Optional[List[str]]*) –

`stubber.rst.rst_utils.compound_candidates`(type: *str*, match\_string: *str*, keywords: *List[str]*, rate: *float* = 0.85, exclude: *List[str] | None* = None)

find and rate possible types and confidence weighting for compound types that can have a subscription. Case sensitive

### Parameters

- **type** (*str*) –
- **match\_string** (*str*) –
- **keywords** (*List[str]*) –
- **rate** (*float*) –
- **exclude** (*Optional[List[str]]*) –

`stubber.rst.rst_utils.object_candidates(match_string: str, rate: float = 0.81, exclude: List[str] | None = None)`

find and rate possible types and confidence weighting for Object types. Case sensitive Exclude defaults to ["IRQ"]

**Parameters**

- **match\_string** (str) –
- **rate** (float) –
- **exclude** (Optional[List[str]]) –

`stubber.rst.rst_utils.distill_return(return_text: str) → List[Dict]`

Find return type and confidence. Returns a list of possible types and confidence weighting. {

```
type :str # the return type confidence: float # the confidence between 0.0 and 1 match: Optional[str]
# for debugging : the reason the match was made

}
```

**Parameters**

**return\_text** (str) –

**Return type**

List[Dict]

`stubber.rst.rst_utils.return_type_from_context(*, docstring: str | List[str], signature: str, module: str, literal: bool = False)`

**Parameters**

- **docstring** (Union[str, List[str]]) –
- **signature** (str) –
- **module** (str) –
- **literal** (bool) –

`stubber.rst.rst_utils._type_from_context(*, docstring: str | List[str], signature: str, module: str, literal: bool = False)`

**Determine the return type of a function or method based on:**

- the function signature
- the terminology used in the docstring

Logic: - if the signature contains a return type → <something> then that is returned - use re to find phrases such as:

- 'Returns .... '
- 'Gets .... '
- docstring is joined without newlines to simplify parsing
- then parses the docstring to find references to known types and give then a rating though a hand coded model ()
- builds a list return type candidates
- selects the highest ranking candidate
- the default Type is 'Any'

## Parameters

- **docstring** (*Union[str, List[str]]*) –
- **signature** (*str*) –
- **module** (*str*) –
- **literal** (*bool*) –

## Package Contents

## Classes

<i>SourceDict</i>	(abstract) dict to store source components respecting parent child dependencies and proper definition order
<i>ModuleSourceDict</i>	(abstract) dict to store source components respecting parent child dependencies and proper definition order
<i>ClassSourceDict</i>	(abstract) dict to store source components respecting parent child dependencies and proper definition order
<i>FunctionSourceDict</i>	(abstract) dict to store source components respecting parent child dependencies and proper definition order

## Functions

<i>sort_classes</i> (classes)	sort a list of classes to respect the parent-child order
<i>simple_candidates</i> (type, match_string, keywords[, ...])	find and rate possible types and confidence weighting for simple types.
<i>compound_candidates</i> (type, match_string, keywords[, ...])	find and rate possible types and confidence weighting for compound types that can have a subscription.
<i>object_candidates</i> (match_string[, rate, exclude])	find and rate possible types and confidence weighting for Object types.
<i>distill_return</i> (→ List[Dict])	Find return type and confidence.
<i>return_type_from_context</i> (*, docstring, signature, module)	
<i>_type_from_context</i> (*, docstring, signature, module[, ...])	Determine the return type of a function or method based on:

## Attributes

<code>LOOKUP_LIST</code>	
<code>NONE_VERBS</code>	
<code>CHILD_PARENT_CLASS</code>	
<code>PARAM_FIXES</code>	
<code>MODULE_GLUE</code>	
<code>RST_DOC_FIXES</code>	
<code>DOCSTUB_SKIP</code>	
<code>U_MODULES</code>	List of modules that are documented with the base name only,
<code>TYPING_IMPORT</code>	
<code>__all__</code>	

`stubber.rst.sort_classes(classes: List[str])`

sort a list of classes to respect the parent-child order

### Parameters

`classes` (List[str]) –

`stubber.rst.LOOKUP_LIST`

`stubber.rst.NONE_VERBS` = ['Activate ', 'Build a ', 'Cancel ', 'Clear ', 'Close ', 'cancel ', 'Configure ', 'Connect ', ...]

`stubber.rst.CHILD_PARENT_CLASS`

`stubber.rst.PARAM_FIXES`

`stubber.rst.MODULE_GLUE`

`stubber.rst.RST_DOC_FIXES` :List[Tuple[str, str]] = [['.. method:: match.', '.. method:: Match.'], [' match.end', ' ...]

`stubber.rst.DOCSTUB_SKIP` = ['uasyncio.rst', 'builtins.rst', 're.rst']

`stubber.rst.U_MODULES` = ['os', 'time', 'array', 'binascii', 'io', 'json', 'select', 'socket', 'ssl', 'struct', 'zlib']

List of modules that are documented with the base name only, but can also be imported with a *u* prefix

**class** `stubber.rst.SourceDict`(base: List, indent: int = 0, body: int = 0, lf: str = '\n')

Bases: OrderedDict

(abstract) dict to store source components respecting parent child dependencies and proper definition order

### Parameters

- **base** (*List*) –
- **indent** (*int*) –
- **body** (*int*) –
- **lf** (*str*) –

**\_\_str\_\_**() → *str*

convert the OD into a string

**Return type**

*str*

**\_\_add\_\_**(*dict*: *SourceDict*)

**Parameters**

**dict** (*SourceDict*) –

**add\_docstr**(*docstr*: *str* | *List[str]*, *extra*: *int* = 0)

**Parameters**

- **docstr** (*Union[str, List[str]]*) –
- **extra** (*int*) –

**add\_comment**(*line*: *str* | *List[str]*)

Add a comment, or list of comments, to this block.

**Parameters**

**line** (*Union[str, List[str]]*) –

**add\_constant**(*line*: *str*, *autoindent*: *bool* = *True*)

add constant to the constant scope of this block

**Parameters**

- **line** (*str*) –
- **autoindent** (*bool*) –

**add\_constant\_smart**(*name*: *str*, *type*: *str* = 'Any', *docstr*: *List[str]* | *None* = *None*, *autoindent*: *bool* = *True*)

add literal / constant to the constant scope of this block, or a class in this block

**Parameters**

- **name** (*str*) –
- **type** (*str*) –
- **docstr** (*Optional[List[str]]*) –
- **autoindent** (*bool*) –

**abstract find**(*name*: *str*) → *str* | *None*

**Parameters**

**name** (*str*) –

**Return type**

*Union[str, None]*

**add\_line**(line: *str*, autoindent: *bool* = True)

**Parameters**

- **line** (*str*) –
- **autoindent** (*bool*) –

**index**(key: *str*)

**Parameters**

**key** (*str*) –

**class** stubber.rst.ModuleSourceDict(name: *str*, indent=0, lf: *str* = '\n')

Bases: *SourceDict*

(abstract) dict to store source components respecting parent child dependencies and proper definition order

**Parameters**

- **name** (*str*) –
- **lf** (*str*) –

**sort**()

make sure all classdefs are in order

**\_\_str\_\_**()

convert the OD into a string

**find**(name: *str*) → *str* | None

find a classnode based on the name with or without the superclass

**Parameters**

**name** (*str*) –

**Return type**

Union[*str*, None]

**classes**()

get a list of the class names in parent-child order

**add\_import**(imports: *str* | List[*str*])

add a [list of] imports this module

**Parameters**

**imports** (Union[*str*, List[*str*]]) –

**class** stubber.rst.ClassSourceDict(name: *str*, \*, docstr: List[*str*] | None = None, init: *str* = "", indent: *int* = 0, lf='\n')

Bases: *SourceDict*

(abstract) dict to store source components respecting parent child dependencies and proper definition order

**Parameters**

- **name** (*str*) –
- **docstr** (Optional[List[*str*]]) –
- **init** (*str*) –
- **indent** (*int*) –

```
class stubber.rst.FunctionSourceDict(name: str, *, definition: List[str] | None = None, docstr: List[str] |
                                     None = None, indent: int = 0, decorators: List[str] | None = None,
                                     lf='\n')
```

Bases: [SourceDict](#)

(abstract) dict to store source components respecting parent child dependencies and proper definition order

#### Parameters

- **name** ([str](#)) –
- **definition** ([Optional](#) [[List](#) [[str](#)]]) –
- **docstr** ([Optional](#) [[List](#) [[str](#)]]) –
- **indent** ([int](#)) –
- **decorators** ([Optional](#) [[List](#) [[str](#)]]) –

```
stubber.rst.simple_candidates(type: str, match_string: str, keywords: List[str], rate: float = 0.5, exclude:
                              List[str] | None = None)
```

find and rate possible types and confidence weighting for simple types. Case sensitive

#### Parameters

- **type** ([str](#)) –
- **match\_string** ([str](#)) –
- **keywords** ([List](#) [[str](#)]) –
- **rate** ([float](#)) –
- **exclude** ([Optional](#) [[List](#) [[str](#)]]) –

```
stubber.rst.compound_candidates(type: str, match_string: str, keywords: List[str], rate: float = 0.85,
                                exclude: List[str] | None = None)
```

find and rate possible types and confidence weighting for compound types that can have a subscription. Case sensitive

#### Parameters

- **type** ([str](#)) –
- **match\_string** ([str](#)) –
- **keywords** ([List](#) [[str](#)]) –
- **rate** ([float](#)) –
- **exclude** ([Optional](#) [[List](#) [[str](#)]]) –

```
stubber.rst.object_candidates(match_string: str, rate: float = 0.81, exclude: List[str] | None = None)
```

find and rate possible types and confidence weighting for Object types. Case sensitive Exclude defaults to ["IRQ"]

#### Parameters

- **match\_string** ([str](#)) –
- **rate** ([float](#)) –
- **exclude** ([Optional](#) [[List](#) [[str](#)]]) –

`stubber.rst.distill_return(return_text: str) → List[Dict]`

Find return type and confidence. Returns a list of possible types and confidence weighting. {

type :str # the return type confidence: float # the confidence between 0.0 and 1 match: Optional[str]  
# for debugging : the reason the match was made

}

**Parameters**

`return_text (str)` –

**Return type**

List[Dict]

`stubber.rst.return_type_from_context(*, docstring: str | List[str], signature: str, module: str, literal: bool = False)`

**Parameters**

- `docstring (Union[str, List[str]])` –
- `signature (str)` –
- `module (str)` –
- `literal (bool)` –

`stubber.rst._type_from_context(*, docstring: str | List[str], signature: str, module: str, literal: bool = False)`

**Determine the return type of a function or method based on:**

- the function signature
- the terminology used in the docstring

Logic: - if the signature contains a return type → <something> then that is returned - use re to find phrases such as:

- ‘Returns ..... ‘
- ‘Gets ..... ‘
- docstring is joined without newlines to simplify parsing
- then parses the docstring to find references to known types and give then a rating though a hand coded model ()
- builds a list return type candidates
- selects the highest ranking candidate
- the default Type is ‘Any’

**Parameters**

- `docstring (Union[str, List[str]])` –
- `signature (str)` –
- `module (str)` –
- `literal (bool)` –

`stubber.rst.TYPING_IMPORT :List[str] = ['from typing import IO, Any, Callable, Coroutine, Dict, Generator, Iterator, List, NoReturn,...`

stubber.rst.\_\_all\_\_

stubber.tools

Submodules

stubber.tools.manifestfile

Module Contents

Classes

*ManifestFile*

Process a firmware manifest files

**exception** stubber.tools.manifestfile.**ManifestFileError**

Bases: **Exception**

Common base class for all non-exit exceptions.

**class** stubber.tools.manifestfile.**ManifestFile**(mode: *int*, path\_vars: *Dict[str, str]* | *None* = *None*)

Process a firmware manifest files

**params:**

mode: *MODE\_\**. The mode to process the manifest in, *MODE\_FREEZE* or *MODE\_COMPILE*.  
path\_vars: dict of path variables to substitute in the manifest.

```
{
    "MPY_DIR": (str) path to the micropython repo, "MPY_LIB_DIR": (str) path to
    the micropython-lib (sub)repo, "PORT_DIR": (str) full path to the port directory,
    "BOARD_DIR": (str) full path to the board directory,
    or the same as PORT_DIR if no port, or the location of a variant's manifest file
}
```

**Parameters**

- **mode** (*int*) –
- **path\_vars** (*Optional[Dict[str, str]]*) –

**\_resolve\_path**(*path*)

**\_manifest\_globals**(*kwargs*)

**files**()

**execute**(*manifest\_file*)

**\_add\_file**(*full\_path*, *target\_path*, *kind=KIND\_AUTO*, *opt=None*)

**\_search**(*base\_path*, *package\_path*, *files*, *exts*, *kind*, *opt=None*, *strict=False*)

**metadata**(*description=None, version=None, license=None*)

From within a manifest file, use this to set the metadata for the package described by current manifest.

After executing a manifest file (via `execute()`), call this to obtain the metadata for the top-level manifest file.

**include**(*manifest\_path, top\_level=False, \*\*kwargs*)

Include another manifest.

The manifest argument can be a string (filename) or an iterable of strings.

Relative paths are resolved with respect to the current manifest file.

If the path is to a directory, then it implicitly includes the `manifest.py` file inside that directory.

Optional kwargs can be provided which will be available to the included script via the *options* variable.

e.g. `include("path.py", extra_features=True)`

**in path.py:**

```
options.defaults(standard_features=True)
```

```
# freeze minimal modules. if options.standard_features:
```

```
    # freeze standard modules.
```

```
if options.extra_features:
```

```
    # freeze extra modules.
```

**require**(*name, version=None, unix ffi=False, \*\*kwargs*)

Require a module by name from micropython-lib.

Optionally specify `unix ffi=True` to use a module from the unix-ffi directory.

**package**(*package\_path, files=None, base\_path='.', opt=None*)

Define a package, optionally restricting to a set of files.

**Simple case, a package in the current directory:**

```
package("foo")
```

will include all `.py` files in `foo`, and will be stored as `foo/bar/baz.py`.

**If the package isn't in the current directory, use base\_path:**

```
package("foo", base_path="src")
```

**To restrict to certain files in the package use files (note: paths should be relative to the package):**

```
package("foo", files=["bar/baz.py"])
```

**module**(*module\_path, base\_path='.', opt=None*)

Include a single Python file as a module.

**If the file is in the current directory:**

```
module("foo.py")
```

**Otherwise use base\_path to locate the file:**

```
module("foo.py", "src/drivers")
```

**\_freeze\_internal**(*path, script, exts, kind, opt*)

**freeze**(*path, script=None, opt=None*)

Freeze the input, automatically determining its type. A `.py` script will be compiled to a `.mpy` first then frozen, and a `.mpy` file will be frozen directly.

*path* must be a directory, which is the base directory to `_search` for files from. When importing the resulting frozen modules, the name of the module will start after *path*, ie *path* is excluded from the module name.

If *path* is relative, it is resolved to the current manifest.py. Use `$(MPY_DIR)`, `$(MPY_LIB_DIR)`, `$(PORT_DIR)`, `$(BOARD_DIR)` if you need to access specific paths.

If *script* is None all files in *path* will be frozen.

If *script* is an iterable then `freeze()` is called on all items of the iterable (with the same *path* and *opt* passed through).

If *script* is a string then it specifies the file or directory to freeze, and can include extra directories before the file or last directory. The file or directory will be `_searched` for in *path*. If *script* is a directory then all files in that directory will be frozen.

*opt* is the optimisation level to pass to mpy-cross when compiling .py to .mpy.

#### **freeze\_as\_str(*path*)**

Freeze the given *path* and all .py scripts within it as a string, which will be compiled upon import.

#### **freeze\_as\_mpy(*path*, *script*=None, *opt*=None)**

Freeze the input (see above) by first compiling the .py scripts to .mpy files, then freezing the resulting .mpy files.

#### **freeze\_mpy(*path*, *script*=None, *opt*=None)**

Freeze the input (see above), which must be .mpy files that are frozen directly.

### stubber.utils

### Submodules

### stubber.utils.config

### Module Contents

### Classes

<i>StubberConfig</i>	stubber configuration class
----------------------	-----------------------------

### Functions

<i>readconfig</i> ([filename, prefix, must_exist])	read the configuration from the pyproject.toml file
--	---

## Attributes

<i>CONFIG</i>	stubber configuration singleton
<b>class</b> stubber.utils.config.StubberConfig( <i>section_name: str   None = None, sources: List[typedconfig.source.ConfigSource]   None = None, provider: typedconfig.provider.ConfigProvider   None = None</i> )	
Bases: typedconfig.config.Config stubber configuration class	
<b>Parameters</b> <ul style="list-style-type: none"> <li>• <b>section_name</b> (<i>Optional[str]</i>) –</li> <li>• <b>sources</b> (<i>Optional[List[typedconfig.source.ConfigSource]]</i>) –</li> <li>• <b>provider</b> (<i>Optional[typedconfig.provider.ConfigProvider]</i>) –</li> </ul>	
<b>stub_path</b>	a Path to the stubs directory
<b>fallback_path</b>	a Path to the fallback stubs directory
<b>repo_path</b>	a Path to the repo directory
<b>mpy_path</b>	a Path to the micropython folder in the repos directory
<b>mpy_lib_path</b>	a Path to the micropython-lib folder in the repos directory
<b>publish_path</b>	a Path to the folder where all stub publication artefacts are stored
<b>template_path</b>	a Path to the publication folder that has the template files
<b>STABLE_VERSION = 1.19.1</b>	last published stable
<b>ALL_VERSIONS = ['1.17', '1.18', '1.19', '1.19.1']</b>	list of recent versions
<b>BLOCKED_PORTS = ['minimal', 'bare-arm']</b>	ports that should be ignored as a source of stubs
<b>post_read_hook() → dict</b>	This method can be overridden to modify config values after read() is called. :rtype: A dict of key-value pairs containing new configuration values for key() items in this Config class
<b>Return type</b>	dict

`stubber.utils.config.readconfig(filename: str = 'pyproject.toml', prefix: str = 'tool.', must_exist: bool = True)`

read the configuration from the pyproject.toml file

#### Parameters

- **filename** (*str*) –
- **prefix** (*str*) –
- **must\_exist** (*bool*) –

`stubber.utils.config.CONFIG`

stubber configuration singleton

`stubber.utils.makeversionhdr`

Code from micropython project and adapted to use the same versioning scheme

## Module Contents

### Functions

<code>get_version_info_from_git([path])</code>	return the version info from the git repository specified.
<code>get_version_build_from_git([path])</code>	

`stubber.utils.makeversionhdr.get_version_info_from_git(path: pathlib.Path = Path.cwd())`

return the version info from the git repository specified. returns: a 2-tuple containing git\_tag, short\_hash

#### Parameters

**path** (*pathlib.Path*) –

`stubber.utils.makeversionhdr.get_version_build_from_git(path: pathlib.Path = Path.cwd())`

#### Parameters

**path** (*pathlib.Path*) –

`stubber.utils.manifest`

Create a *module.json* manifest listing all files/stubs in this folder and subfolders.

## Module Contents

### Functions

<code>manifest(→ dict)</code>	create a new empty manifest dict
<code>make_manifest(→ bool)</code>	Create a <i>module.json</i> manifest listing all files/stubs in this folder and subfolders.

`stubber.utils.manifest.manifest`(family: *str* = 'micropython', stubtype: *str* = 'frozen', machine: *str* | *None* = *None*, port: *str* | *None* = *None*, platform: *str* | *None* = *None*, sysname: *str* | *None* = *None*, nodename: *str* | *None* = *None*, version: *str* | *None* = *None*, release: *str* | *None* = *None*, firmware: *str* | *None* = *None*) → dict

create a new empty manifest dict

#### Parameters

- **family** (*str*) –
- **stubtype** (*str*) –
- **machine** (*Optional*[*str*]) –
- **port** (*Optional*[*str*]) –
- **platform** (*Optional*[*str*]) –
- **sysname** (*Optional*[*str*]) –
- **nodename** (*Optional*[*str*]) –
- **version** (*Optional*[*str*]) –
- **release** (*Optional*[*str*]) –
- **firmware** (*Optional*[*str*]) –

#### Return type

dict

`stubber.utils.manifest.make_manifest`(folder: *pathlib.Path*, family: *str*, port: *str*, version: *str*, release: *str* = "", stubtype: *str* = "", board: *str* = "") → bool

Create a *module.json* manifest listing all files/stubs in this folder and subfolders.

#### Parameters

- **folder** (*pathlib.Path*) –
- **family** (*str*) –
- **port** (*str*) –
- **version** (*str*) –
- **release** (*str*) –
- **stubtype** (*str*) –
- **board** (*str*) –

#### Return type

bool

## stubber.utils.my\_version

find the version of this package

## Module Contents

```
stubber.utils.my_version.__version__ = 0.0.0
```

```
stubber.utils.my_version.__version__
```

## stubber.utils.post

Pre/Post Processing for createstubs.py

## Module Contents

### Functions

<code>do_post_processing(stub_paths, pyi, black)</code>	Common post processing
<code>run_black(path[, capture_output])</code>	run black to format the code / stubs
<code>run_autoflake(path[, capture_output, progress_pyi])</code>	run autoflake to remove unused imports

```
stubber.utils.post.do_post_processing(stub_paths: List[pathlib.Path], pyi: bool, black: bool)
```

Common post processing

#### Parameters

- **stub\_paths** (*List[pathlib.Path]*) –
- **pyi** (*bool*) –
- **black** (*bool*) –

```
stubber.utils.post.run_black(path: pathlib.Path, capture_output=False)
```

run black to format the code / stubs

#### Parameters

**path** (*pathlib.Path*) –

```
stubber.utils.post.run_autoflake(path: pathlib.Path, capture_output=False, progress_pyi=False)
```

run autoflake to remove unused imports needs to be run BEFORE black otherwise it does not recognize long import from`s. note: is run file-by-file to include processing .pyi files

#### Parameters

**path** (*pathlib.Path*) –

## stubber.utils.repos

utility functions to handle to cloned repos needed for stubbing.

## Module Contents

### Functions

<code>switch(tag, *, mpy_path, mpy_lib_path)</code>	Switch to a specific version of the micropython repos.
<code>read_micropython_lib_commits([filename])</code>	Read a csv with the micropython version and matchin micropython-lib commit-hashes
<code>match_lib_with_mpy(version_tag, lib_path)</code>	
<code>fetch_repos(tag, mpy_path, mpy_lib_path)</code>	Fetch updates , then switch to the provided tag
<code>repo_paths(→ Tuple[pathlib.Path, pathlib.Path])</code>	Return the paths to the micropython and micropython-lib repos, given a path to the repos.'

`stubber.utils.repos.switch(tag: str, *, mpy_path: pathlib.Path, mpy_lib_path: pathlib.Path)`

Switch to a specific version of the micropython repos.

Specify the version with `-tag` or `-version` to specify the version tag of the MicroPython repo. The Micropython-lib repo will be checked out to a commit that corresponds in time to that version tag, in order to allow non-current versions to be stubbed correctly.

The repos must be cloned already

#### Parameters

- **tag** (*str*) –
- **mpy\_path** (*pathlib.Path*) –
- **mpy\_lib\_path** (*pathlib.Path*) –

`stubber.utils.repos.read_micropython_lib_commits(filename='data/micropython_tags.csv')`

Read a csv with the micropython version and matchin micropython-lib commit-hashes these can be used to make sure that the correct micropython-lib version is checked out.

filename is relative to the 'stubber' package

TODO: it would be nice if micropython-lib had matching commit-tags

`git for-each-ref --sort=creatordate --format '%(refname) %(creatordate)' refs/tags`

`stubber.utils.repos.match_lib_with_mpy(version_tag: str, lib_path: pathlib.Path)`

#### Parameters

- **version\_tag** (*str*) –
- **lib\_path** (*pathlib.Path*) –

`stubber.utils.repos.fetch_repos(tag, mpy_path: pathlib.Path, mpy_lib_path: pathlib.Path)`

Fetch updates , then switch to the provided tag

#### Parameters

- **mpy\_path** (*pathlib.Path*) –

- `mpy_lib_path(pathlib.Path)` –

`stubber.utils.repos.repo_paths(dest_path: pathlib.Path) → Tuple[pathlib.Path, pathlib.Path]`

Return the paths to the micropython and micropython-lib repos, given a path to the repos.’

**Parameters**

`dest_path(pathlib.Path)` –

**Return type**

`Tuple[pathlib.Path, pathlib.Path]`

## stubber.utils.stubmaker

Generate stub files for micropython modules using mypy/stubgen

## Module Contents

## Functions

<code>generate_pyi_from_file(→ bool)</code>	Generate a .pyi stubfile from a single .py module using mypy/stubgen
<code>generate_pyi_files(→ bool)</code>	Generate typeshed files for all scripts in a folder using mypy/stubgen

## Attributes

<code>STUBGEN_OPT</code>
--------------------------

`stubber.utils.stubmaker.STUBGEN_OPT`

`stubber.utils.stubmaker.generate_pyi_from_file(file: pathlib.Path) → bool`

Generate a .pyi stubfile from a single .py module using mypy/stubgen

**Parameters**

`file(pathlib.Path)` –

**Return type**

`bool`

`stubber.utils.stubmaker.generate_pyi_files(modules_folder: pathlib.Path) → bool`

Generate typeshed files for all scripts in a folder using mypy/stubgen

Returns: False if one or more files had an issue generating a stub

**Parameters**

`modules_folder(pathlib.Path)` –

**Return type**

`bool`

## stubber.utils.typed\_config\_toml

typed-config-toml

Extend typed-config to read configuration from .toml files

## Module Contents

### Classes

*TomlConfigSource*

Read configuration from a .toml file

```
class stubber.utils.typed_config_toml.TomlConfigSource(filename: str, prefix: str | None = None,
                                                         must_exist: bool = True)
```

Bases: `typedconfig.source.ConfigSource`

Read configuration from a .toml file

prefix is used to allow for toml nested configuration a common prefix = "tool."

```
` #pyproject.toml [tool.deadparrot] species = "Norwegian Blue" state = "resting"
details = ["pinging", "Lovely plumage", "3"] ` Use the below code to retrieve: ` # TODO sample
code `
```

#### Parameters

- **filename** (*str*) –
- **prefix** (*Optional[str]*) –
- **must\_exist** (*bool*) –

```
get_config_value(section_name: str, key_name: str) → str | None
```

#### Parameters

- **section\_name** (*str*) –
- **key\_name** (*str*) –

#### Return type

*Optional[str]*

## stubber.utils.versions

Handle versions of micropython based on the git tags in the repo

## Module Contents

### Functions

<code>clean_version(version, *, build, patch, commit, ...)</code>	Clean up and transform the many flavours of versions
<code>micropython_versions([start])</code>	Get the list of micropython versions from github tags

`stubber.utils.versions.clean_version(version: str, *, build: bool = False, patch: bool = False, commit: bool = False, drop_v: bool = False, flat: bool = False)`

Clean up and transform the many flavours of versions

#### Parameters

- **version** (*str*) –
- **build** (*bool*) –
- **patch** (*bool*) –
- **commit** (*bool*) –
- **drop\_v** (*bool*) –
- **flat** (*bool*) –

`stubber.utils.versions.micropython_versions(start='v1.9.2')`

Get the list of micropython versions from github tags

## Package Contents

### Functions

<code>make_manifest(→ bool)</code>	Create a <i>module.json</i> manifest listing all files/stubs in this folder and subfolders.
<code>manifest(→ dict)</code>	create a new empty manifest dict
<code>do_post_processing(stub_paths, pyi, black)</code>	Common post processing
<code>generate_pyi_files(→ bool)</code>	Generate typeshed files for all scripts in a folder using mypy/stubgen
<code>generate_pyi_from_file(→ bool)</code>	Generate a .pyi stubfile from a single .py module using mypy/stubgen
<code>clean_version(version, *, build, patch, commit, ...)</code>	Clean up and transform the many flavours of versions

`stubber.utils.make_manifest(folder: pathlib.Path, family: str, port: str, version: str, release: str = "", stubtype: str = "", board: str = "") → bool`

Create a *module.json* manifest listing all files/stubs in this folder and subfolders.

#### Parameters

- **folder** (*pathlib.Path*) –
- **family** (*str*) –
- **port** (*str*) –
- **version** (*str*) –

- **release** (*str*) –
- **subtype** (*str*) –
- **board** (*str*) –

**Return type**

*bool*

`stubber.utils.manifest(family: str = 'micropython', subtype: str = 'frozen', machine: str | None = None, port: str | None = None, platform: str | None = None, sysname: str | None = None, nodename: str | None = None, version: str | None = None, release: str | None = None, firmware: str | None = None) → dict`

create a new empty manifest dict

**Parameters**

- **family** (*str*) –
- **subtype** (*str*) –
- **machine** (*Optional*[*str*]) –
- **port** (*Optional*[*str*]) –
- **platform** (*Optional*[*str*]) –
- **sysname** (*Optional*[*str*]) –
- **nodename** (*Optional*[*str*]) –
- **version** (*Optional*[*str*]) –
- **release** (*Optional*[*str*]) –
- **firmware** (*Optional*[*str*]) –

**Return type**

*dict*

`stubber.utils.do_post_processing(stub_paths: List[pathlib.Path], pyi: bool, black: bool)`

Common post processing

**Parameters**

- **stub\_paths** (*List*[*pathlib.Path*]) –
- **pyi** (*bool*) –
- **black** (*bool*) –

`stubber.utils.generate_pyi_files(modules_folder: pathlib.Path) → bool`

Generate typeshed files for all scripts in a folder using mypy/stubgen

Returns: False if one or more files had an issue generating a stub

**Parameters**

**modules\_folder** (*pathlib.Path*) –

**Return type**

*bool*

`stubber.utils.generate_pyi_from_file(file: pathlib.Path) → bool`

Generate a .pyi stubfile from a single .py module using mypy/stubgen

#### Parameters

**file** (*pathlib.Path*) –

#### Return type

*bool*

`stubber.utils.clean_version(version: str, *, build: bool = False, patch: bool = False, commit: bool = False, drop_v: bool = False, flat: bool = False)`

Clean up and transform the many flavours of versions

#### Parameters

- **version** (*str*) –
- **build** (*bool*) –
- **patch** (*bool*) –
- **commit** (*bool*) –
- **drop\_v** (*bool*) –
- **flat** (*bool*) –

## 33.5.2 Submodules

### stubber.basicgit

simple Git module, where needed via powershell

#### Module Contents

#### Functions

<code>_run_git(cmd[, repo, expect_stderr, capture_output, ...])</code>	run a external (git) command in the repo's folder and deal with some of the errors
<code>clone(→ bool)</code>	git clone [--depth 1] [--branch <tag_name>] <remote> <directory>
<code>get_tag(→ Union[str, None])</code>	get the most recent git version tag of a local repo
<code>get_tags(→ List[str])</code>	get list of tag of a local repo
<code>checkout_tag(→ bool)</code>	checkout a specific git tag
<code>synch_submodules(→ bool)</code>	make sure any submodules are in syncj
<code>checkout_commit(→ bool)</code>	Checkout a specific commit
<code>switch_tag(→ bool)</code>	switch to the specified version tag of a local repo
<code>switch_branch(→ bool)</code>	switch to the specified branch in a local repo"
<code>fetch(→ bool)</code>	fetches a repo
<code>pull(→ bool)</code>	pull a repo origin into main
<code>get_git_describe([folder])</code>	"based on MicroPython makeversionhdr

`stubber.basicgit._run_git(cmd: List[str], repo: pathlib.Path | str | None = None, expect_stderr=False, capture_output=True, echo_output=True)`

run a external (git) command in the repo's folder and deal with some of the errors

#### Parameters

- **cmd** (*List*[*str*]) –
- **repo** (*Optional*[*Union*[*pathlib.Path*, *str*]]) –

`stubber.basicgit.clone(remote_repo: str, path: pathlib.Path, shallow=False, tag: str | None = None) → bool`  
 git clone [-depth 1] [-branch <tag\_name>] <remote> <directory>

**Parameters**

- **remote\_repo** (*str*) –
- **path** (*pathlib.Path*) –
- **tag** (*Optional*[*str*]) –

**Return type**

*bool*

`stubber.basicgit.get_tag(repo: str | pathlib.Path | None = None, abbreviate: bool = True) → str | None`  
 get the most recent git version tag of a local repo repo Path should be in the form of : repo = “./repo/micropython”  
 returns the tag or None

**Parameters**

- **repo** (*Optional*[*Union*[*str*, *pathlib.Path*]]) –
- **abbreviate** (*bool*) –

**Return type**

*Union*[*str*, *None*]

`stubber.basicgit.get_tags(repo: pathlib.Path | None = None, minver: str | None = None) → List[str]`  
 get list of tag of a local repo

**Parameters**

- **repo** (*Optional*[*pathlib.Path*]) –
- **minver** (*Optional*[*str*]) –

**Return type**

*List*[*str*]

`stubber.basicgit.checkout_tag(tag: str, repo: str | pathlib.Path | None = None) → bool`  
 checkout a specific git tag

**Parameters**

- **tag** (*str*) –
- **repo** (*Optional*[*Union*[*str*, *pathlib.Path*]]) –

**Return type**

*bool*

`stubber.basicgit.synch_submodules(repo: pathlib.Path | str | None = None) → bool`  
 make sure any submodules are in syncj

**Parameters**

**repo** (*Optional*[*Union*[*pathlib.Path*, *str*]]) –

**Return type**

*bool*

`stubber.basicgit.checkout_commit(commit_hash: str, repo: pathlib.Path | str | None = None) → bool`

Checkout a specific commit

**Parameters**

- `commit_hash` (*str*) –
- `repo` (*Optional[Union[pathlib.Path, str]]*) –

**Return type**

*bool*

`stubber.basicgit.switch_tag(tag: str, repo: pathlib.Path | str | None = None) → bool`

switch to the specified version tag of a local repo repo should be in the form of : path/.git repo = ‘../micropython/.git’ returns None

**Parameters**

- `tag` (*str*) –
- `repo` (*Optional[Union[pathlib.Path, str]]*) –

**Return type**

*bool*

`stubber.basicgit.switch_branch(branch: str, repo: pathlib.Path | str | None = None) → bool`

switch to the specified branch in a local repo” repo should be in the form of : path/.git repo = ‘../micropython/.git’ returns None

**Parameters**

- `branch` (*str*) –
- `repo` (*Optional[Union[pathlib.Path, str]]*) –

**Return type**

*bool*

`stubber.basicgit.fetch(repo: pathlib.Path | str) → bool`

fetches a repo repo should be in the form of : path/.git repo = ‘../micropython/.git’ returns True on success

**Parameters**

`repo` (*Union[pathlib.Path, str]*) –

**Return type**

*bool*

`stubber.basicgit.pull(repo: pathlib.Path | str, branch='main') → bool`

pull a repo origin into main repo should be in the form of : path/.git repo = ‘../micropython/.git’ returns True on success

**Parameters**

`repo` (*Union[pathlib.Path, str]*) –

**Return type**

*bool*

`stubber.basicgit.get_git_describe(folder: str | None = None)`

“based on MicroPython makeversionhdr returns : current git tag, commits ,commit hash : “v1.19.1-841-g3446”

**Parameters**

`folder` (*Optional[str]*) –

stubber.cst\_transformer

## Module Contents

### Classes

<i>TypeInfo</i>	contains the functiondefs and classdefs info read from the stubs source
<i>StubTypingCollector</i>	Collect the function/method and class definitions from the stubs source

### Functions

<i>update_def_docstr</i> (→ Any)	Update the docstring of a function/method or class
<i>update_module_docstr</i> (→ Any)	Update the docstring of a module

### Attributes

<i>MODULE_KEY</i>
<i>_m</i>

```
class stubber.cst_transformer.TypeInfo
    contains the functiondefs and classdefs info read from the stubs source
    name :str

    decorators :Sequence[libcst.Decorator]
    params :Optional[libcst.Parameters]
    returns :Optional[libcst.Annotation]
    docstr_node :Optional[libcst.SimpleStatementLine]
    def_node :Optional[Union[libcst.FunctionDef, libcst.ClassDef]]
    def_type :str = ?
```

```
exception stubber.cst_transformer.TransformError
    Bases: Exception
    Error raised upon encountering a known error while attempting to transform the tree.
stubber.cst_transformer.MODULE_KEY = ['__module']
stubber.cst_transformer._m
```

**class** stubber.cst\_transformer.StubTypingCollector

Bases: libcst.CSTVisitor

Collect the function/method and class definitions from the stubs source

**visit\_Module**(*node*: libcst.Module) → bool

Store the module docstring

**Parameters**

**node** (libcst.Module) –

**Return type**

bool

**visit\_ClassDef**(*node*: libcst.ClassDef) → bool | None

collect info from a classdef: - name, decorators, docstring

**Parameters**

**node** (libcst.ClassDef) –

**Return type**

Optional[bool]

**leave\_ClassDef**(*original\_node*: libcst.ClassDef) → None

remove the class name from the stack

**Parameters**

**original\_node** (libcst.ClassDef) –

**Return type**

None

**visit\_FunctionDef**(*node*: libcst.FunctionDef) → bool | None

collect info from a function/method - name, decorators, params, returns, docstring

**Parameters**

**node** (libcst.FunctionDef) –

**Return type**

Optional[bool]

**update\_append\_first\_node**(*node*)

Store the function/method docstring or function/method sig

**leave\_FunctionDef**(*original\_node*: libcst.FunctionDef) → None

remove the function/method name from the stack

**Parameters**

**original\_node** (libcst.FunctionDef) –

**Return type**

None

stubber.cst\_transformer.**update\_def\_docstr**(*dest\_node*: libcst.FunctionDef | libcst.ClassDef,  
*src\_comment*: libcst.SimpleStatementLine | None,  
*src\_node*=None) → Any

Update the docstring of a function/method or class

for functiondefs ending in an ellipsis, the entire body needs to be replaced. in this case the *src\_body* is mandatory.

**Parameters**

- **dest\_node** (Union[libcst.FunctionDef, libcst.ClassDef]) –

- **src\_comment** (*Optional*[*libcst.SimpleStatementLine*]) –

**Return type**

Any

`stubber.cst_transformer.update_module_docstr`(*node*: *libcst.Module*, *doc\_tree*: *libcst.SimpleStatementLine* | *None*) → Any

Update the docstring of a module

**Parameters**

- **node** (*libcst.Module*) –
- **doc\_tree** (*Optional*[*libcst.SimpleStatementLine*]) –

**Return type**

Any

## stubber.downloader

Download files from a public github repo

## Module Contents

### Functions

<code>download_file</code> ( <i>url</i> , <i>module</i> [, <i>folder</i> ])	download a file from a public github repo
<code>download_files</code> ( <i>repo</i> , <i>frozen_modules</i> , <i>savepath</i> )	download multiple files from a public github repo

`stubber.downloader.download_file`(*url*: *str*, *module*: *str*, *folder*: *str* = '/')

download a file from a public github repo

**Parameters**

- **url** (*str*) –
- **module** (*str*) –
- **folder** (*str*) –

`stubber.downloader.download_files`(*repo*, *frozen\_modules*, *savepath*)

download multiple files from a public github repo

## stubber.get\_cpython

Download or update the micropython compatibility modules from pycopy and stores them in the all\_stubs folder The all\_stubs folder should be mapped/symlinked to the micropython\_stubs/stubs repo/folder

## Module Contents

### Functions

<code>get_core(requirements[, stub_path, family])</code>	Download MicroPython compatibility modules
--	--

`stubber.get_cpython.get_core(requirements, stub_path=None, family: str = 'core')`

Download MicroPython compatibility modules

#### Parameters

**family** (*str*) –

### `stubber.get_lobo`

Collect modules and python stubs from the Loboris MicroPython source project and stores them in the all\_stubs folder  
The all\_stubs folder should be mapped/symlinked to the micropython\_stubs/stubs repo/folder

## Module Contents

### Functions

<code>get_frozen([stub_path, repo, version])</code>	Download Loboris frozen modules direct from github repo
---	---

### Attributes

<i>FAMILY</i>
<i>PORT</i>

`stubber.get_lobo.FAMILY = loboris`

`stubber.get_lobo.PORT = esp32_lobo`

`stubber.get_lobo.get_frozen(stub_path: pathlib.Path | None = None, *, repo: str | None = None, version='3.2.24')`

Download Loboris frozen modules direct from github repo

#### Parameters

- **stub\_path** (*Optional[pathlib.Path]*) –
- **repo** (*Optional[str]*) –

## stubber.minify

Processing for createstubs.py minimizes and cross-compiles a micropython file.

## Module Contents

### Functions

<code>edit_lines</code> (content, edits[, diff])	Edit string by list of edits
<code>minify_script</code> (→ str)	minifies createstubs.py
<code>minify</code> (source, target[, keep_report, diff, cross_compile])	
<code>minify_and_compile</code> (target, cross_compile, target_buf, ...)	

### Attributes

<code>python_minifier</code>
------------------------------

stubber.minify.python\_minifier

stubber.minify.edit\_lines(content, edits, diff=False)

Edit string by list of edits

#### Parameters

- **content** (*str*) – content to edit
- **edits** (*[ (str, str) ]*) – List of edits to make. The first string in the tuple represents the type of edit to make, can be either: - comment - comment text out (removed on minify) - rprint - replace text with print - rpass - replace text with pass The second string is the matching text to replace
- **diff** (*bool*, *optional*) – Prints diff of each edit. Defaults to False.

#### Returns

edited string

#### Return type

str

stubber.minify.minify\_script(source\_script: *pathlib.Path* | *str* | *IO[str]*, keep\_report=True, diff=False) → str

minifies createstubs.py

#### Parameters

- **keep\_report** (*bool*, *optional*) – Keeps single report line in createstubs Defaults to True.
- **diff** (*bool*, *optional*) – Print diff from edits. Defaults to False.
- **source\_script** (*Union[pathlib.Path, str, IO[str]]*) –

#### Returns

minified source text

### Return type

`str`

`stubber.minify.minify(source: str | pathlib.Path | IO[str], target: str | pathlib.Path | IO[str] | IO[bytes], keep_report: bool = True, diff: bool = False, cross_compile: bool = False)`

### Parameters

- **source** (`Union[str, pathlib.Path, IO[str]]`) –
- **target** (`Union[str, pathlib.Path, IO[str], IO[bytes]]`) –
- **keep\_report** (`bool`) –
- **diff** (`bool`) –
- **cross\_compile** (`bool`) –

`stubber.minify.minify_and_compile(target, cross_compile, target_buf, minified)`

## stubber.stubber

Create, Process, and Maintain stubs for MicroPython

## stubber.stubs\_from\_docs

Read the Micropython library documentation files and use them to build stubs that can be used for static typechecking using a custom-built parser to read and process the micropython RST files

## Module Contents

### Functions

<code>generate_from_rst(→ int)</code>	
<code>clean_destination(dst_path)</code>	Remove all .py/.pyi files in desination folder to avoid left-behinds
<code>get_rst_sources(→ List[pathlib.Path])</code>	Get the list of rst files to process
<code>make_docstubs(dst_path, v_tag, release, suffix, files)</code>	Create the docstubs

`stubber.stubs_from_docs.generate_from_rst(rst_path: pathlib.Path, dst_path: pathlib.Path, v_tag: str, release: str | None = None, pattern: str = '*.rst', suffix='py') → int`

### Parameters

- **rst\_path** (`pathlib.Path`) –
- **dst\_path** (`pathlib.Path`) –
- **v\_tag** (`str`) –
- **release** (`Optional[str]`) –
- **pattern** (`str`) –

#### Return type

`int`

`stubber.stubs_from_docs.clean_destination(dst_path)`

Remove all .py/.pyi files in desination folder to avoid left-behinds

`stubber.stubs_from_docs.get_rst_sources(rst_path: pathlib.Path, pattern: str) → List[pathlib.Path]`

Get the list of rst files to process

#### Parameters

- **rst\_path** (*pathlib.Path*) –
- **pattern** (*str*) –

#### Return type

List[*pathlib.Path*]

`stubber.stubs_from_docs.make_docstubs(dst_path: pathlib.Path, v_tag: str, release: str, suffix: str, files: List[pathlib.Path])`

Create the docstubs

#### Parameters

- **dst\_path** (*pathlib.Path*) –
- **v\_tag** (*str*) –
- **release** (*str*) –
- **suffix** (*str*) –
- **files** (List[*pathlib.Path*]) –

`stubber.update_fallback`

## Module Contents

### Functions

<code>fallback_sources(→ List[Tuple[str, str]])</code>	list of sources to build/update the fallback 'catch-all' stubfolder
<code>update_fallback(stubpath, fallback_path[, version])</code>	update the fallback stubs from the defined sources

### Attributes

<code>RELEASED</code>
-----------------------

`stubber.update_fallback.RELEASED = v1_18`

`stubber.update_fallback.fallback_sources(version: str, fw_version: str | None = None) → List[Tuple[str, str]]`

list of sources to build/update the fallback 'catch-all' stubfolder version : the version to use fw\_version : version to source the Firmware stubs from. defaults to the version used , but can be lower

#### Parameters

- **version** (*str*) –
- **fw\_version** (*Optional[str]*) –

#### Return type

List[Tuple[str, str]]

`stubber.update_fallback.update_fallback(stubpath: pathlib.Path, fallback_path: pathlib.Path, version: str = RELEASED)`

update the fallback stubs from the defined sources

#### Parameters

- **stubpath** (*pathlib.Path*) –
- **fallback\_path** (*pathlib.Path*) –
- **version** (*str*) –

### stubber.update\_module\_list

generate the list of modules that should be attempted to stub for this : - combine the modules from the different texts files - split the lines into individual module names - combine them in one set - remove the ones than cannot be stubbed - remove test modules, ending in *\_test* - write updates to:

- board/modulelist.txt
- board/createsubs.py
- TODO: remove the frozen modules from this list
- TODO: bump patch number if there are actual changes

## Module Contents

### Functions

<code>read_modules(→ Set[str])</code>	read text files with modules per firmware.
<code>main()</code>	helper script

`stubber.update_module_list.read_modules(path: pathlib.Path | None = None) → Set[str]`

read text files with modules per firmware. each contains the output of help("modules") - lines starting with # are comments. - split the other lines at whitespace separator, - and add each module to a set

#### Parameters

**path** (*Optional[pathlib.Path]*) –

#### Return type

Set[str]

`stubber.update_module_list.main()`

helper script generate a few lines of code with all modules to be stubbed by `createstubs`

### 33.5.3 Package Contents
